13. ABSTRACT Chronic toxic effects of 1,3,5-trinitrobenzene (TNB) in male and female Fischer rats were evaluated by feeding certified powdered laboratory chow diet supplemented with varied concentrations of TNB (0, 5, 60 and 300 mg/kg diet). The study was designed to accommodate three interim sacrifices (10 rats/group/sex) at 90, 180 and 365 days. The final sacrifice was performed after two years. All data related to these interim sacrifices are presented independently in appendices J to L. The calculated average TNB consumption for females was 0.23, 2.68 and 13.31 mg/kg/day and was 0.22, 2.64 and 13.44 mg/kg/day for males. Terminal body weights were significantly decreased in both sexes in the 300 mg/kg group. Relative spleen weights were decreased in both sexes in the 300 mg/kg group while brain weights were increased in females in this same group. Methemoglobin was increased in both sexes in the 300 mg/kg group while other hematological effects noted at the interim sacrifice times were not evident at two years. Histopathological examinations suggested treatment related changes in both sexes involving the kidneys (cytoplasmic/hyaline droplets) in the 60 and 300 mg/kg groups and the spleen (erythroid cell hyperplasia and pigment deposition) in the 300 mg/kg group. The cytoplasmic/hyaline droplets were characterized by immunohistochemistry as alpha-2μ-globulin. These renal droplets were also noted at the interim sacrifice times. A no observed adverse effect level (NOAEL) was established in this study at 2.68 mg/kg b.w./day for F-344 rats administered TNB for two years.

Compliance Statement

This study was conducted in compliance with the Good Laboratory Practice Regulations as set forth in Title 21 of the U.S. Code of Federal Regulations Part 792 issued August 17, 1989. All deviations from the protocol and/or GLPs are listed in Appendix J. There were no deviations from the aforementioned regulations which affected the quality or integrity of the study or the interpretation of the results in the report.

INTRODUCTION

Nitroaromatics, such as 1,3-dinitrobenzene (DNB), 1,3,5-trinitrobenzene (TNB), and N-methyl-N,2,4,6-tetranitroaniline (tetryl), have been detected as environmental contaminants of groundwater and soil near production sites and in some instances at military test grounds. TNB is formed as a by-product during 2,4,6-trinitrotoluene (TNT) production and can be formed through photochemical oxidative degradation of TNT manufacturing (Burlinson, 1980; Spanggord et al., 1982). TNB is not easily biodegradable, persists in the environment, eventually leaches out, and contaminates groundwater near waste disposal sites (Garman et al., 1987). Exposure to TNB can occur through contact with wastewaters and soil at the original production sites and other plants devoted to munitions assembly which contain large quantities of these nitroaromatic compounds (Walsh and Jenkins, 1992).

Toxicity data on these compounds are limited. The oral LD₅₀ of DNB, TNB and tetryl were 59 mg/kg, 284 mg/kg and greater than 5 g/kg, respectively, in rats for combined sexes. TNB and tetryl were not toxic at 2 g/kg when applied to rabbit skin for 24 hours. However, the dermal LD₅₀ of DNB was 1.99 g/kg for combined sexes of rabbits. None of these compounds produced skin irritation but positive (DNB) and severe (TNB, tetryl) eye irritation potentials in rabbits were noted. The sensitization tests showed that DNB and tetryl are not skin sensitizers while TNB caused a mild allergic reaction in guinea pigs (Fitzgerald et al., 1992 a,b,c). Some of the toxicological effects of TNB are: formation of methemoglobin, testicular degeneration and reproductive failure, weight loss and anemia, in hamsters, rats and mice. Neurological and hematological disorders have also been reported in dogs. DNB is toxic to humans; the estimated lethal dose range is 5-50 mg/kg and is readily absorbed through the skin (Von Burg, 1989). Tetryl was observed to be a powerful skin sensitizer in ammunition plant workers, with dermatitis, liver atrophy, spleen effects, headaches, weight loss and respiratory irritation reported following exposure (U.S. EPA, 1990). Atmospheric concentration of 1.5 mg/m³ or below did not produce systemic poisoning in persons working with tetryl. DNB, TNB and tetryl have been shown to be genotoxic in the Salmonella mutagenesis assay (McGregor et al., 1989) while TNB and DNB have been shown to form adducts with blood proteins and tissue DNA in rats (Reddy et. al.; 1991, 1995).

Objective of the Study

This study was conducted in order to evaluate the toxicity of 1,3,5-trinitrobenzene when administered in the diet for a two year period.

MATERIALS AND METHODS

Test Material Preparation

1,3,5-trinitrobenzene powder (CAS #99-35-4; 99.67% pure) was supplied by the U.S. Army Biomedical Research and Development Laboratory. Analysis by HPLC revealed no detectable impurities. Certified powdered Purina Laboratory Chow 5002 was purchased (Ralston-Purina Co., St. Louis, MO) and stored at 4°C until used. First, 0.3 g of TNB was added to 50 g of powdered diet in a mortar and thoroughly ground with a pestle. Afterwards 250 g of the diet was added and mixed for 15 minutes followed by 350 g and mixed for an additional 15 minutes. Finally, the remaining diet (350 g) was added and mixed for 30 minutes in a mechanical mixer (Kitchen Aid, St. Joseph, MI) for uniform distribution of TNB in the diet. This was verified by determining the TNB concentration in the diet, taken from each of the 1 kg mixtures, by quantitative analysis done by HPLC. The premixed diet (0.3 g/kg) was further diluted with fresh powdered diet to obtain the desired TNB concentration in the lower dose groups. The diet feeders were changed twice a week.

Analyses of the TNB-feed mixtures were carried out on acetone extracts of the mixtures, utilizing a Waters 600E chromatography system (Waters, Milford, MA), equipped with a 490E programmable multiwavelength detector, operating at 245 nm. The entire chromatography system was interfaced with a Berthold HPLC computer program, Version 1.65 (Berthold, Nashua, NH). The TNB was eluted from a Zorbax C-8 column (9.4 mm x 25 cm) (MAC-DOD Analytical, Chadds Ford, PA) with a water-methanol gradient, at a flow rate of 3 ml/min. Working standards were prepared in Burdick and Jackson HPLC grade high purity methanol (Baxter, Oletz, OH).

Animals and Maintenance

Male and female Fischer 344 rats, confirmed free of viral antibodies, bacteria and parasites, were obtained from Charles River Laboratories, Kingston, New York. The animals, 7-8 weeks old and weighing approximately 140-175 g when delivered, were held for 1 week in quarantine prior to initiation of treatment. The animals were housed in a temperature (22-23°C) and humidity (40-60%) controlled room on a 12:12 hour light:dark cycle. For the study, they were housed individually in polycarbonate cages and water was administered ad libitum. Animal identification was done using electronic implants (Bio Medic, Maywood, NJ) with the rats assigned to control and treatment groups according to a computer-generated set of random numbers. The weight variation of the animals of each sex used did not exceed ± 2 s.d. of the mean weight at the time of delivery. The cages were identified with a color-coded identification card indicating the animal and treatment group. All aspects of the study were conducted in compliance with the guidelines of the American Association for Accreditation of Laboratory Animal Care.

All rats were observed daily for physiological and behavioral responses as well as for mortality or morbidity. Food and water consumption were recorded twice weekly. Body weights were taken prior to the start of the study, once weekly during the study and at the final sacrifice.

Experiment Groups

Group	Sex	mg TNB/kg diet
1	F	300
2	F	60
3	F	5
4	F	0
5	M	300
6	M	60
7	M	5
8	M	0

Hematology and Clinical Chemistry

Hematology parameters were assessed using a Serono-Baker Hematology Analyzer, Model 9000 (Serono-Baker, Allentown, PA). Total red and white blood cell counts, platelet count, differential leukocyte count, hemoglobin, packed cell volume, reticulocytes, MCV, MCH, MCHC and Heinz bodies were measured and computed. Methemoglobin samples were analyzed on a IL 482 Co-Oximeter.

Clinical chemistry was performed using a COBAS Fara II centrifugal analyzer (Roche, Nutley, NJ) with a non-selective electrode module. Clinical chemistry analytes included sodium, potassium, total protein, albumin, calcium, phosphorus, total bilirubin, blood urea nitrogen, creatinine, alanine aminotransferase, triglycerides, cholesterol, aspartate aminotransferase, glucose and alkaline phosphatase.

Statistical Evaluation

Males and females were considered separately in all statistical analyses. A one-factor (dose) analysis of variance (ANOVA) was used to analyze normally distributed measures: body weights, organ weights, organ weight ratios, food and water consumption, hematology and clinical chemistry. When a treatment effect was noted ($p \leq 0.05$, F-test) the difference between the control and the treatment groups was probed using a multiple comparison procedure (Dunnett's or Tukey's test). Due to the high variability of some of the measures, a nonparametric analysis of variance, the Wilcoxon Rank Sum Test, was used where appropriate.

Necropsy and Histopathology

Necropsies were performed on all animals including those found dead unless, they were excessively autolyzed or cannibalized. Thus, the number of animals from which particular organs or tissues were examined microscopically varies and is not necessarily equal to the number of animals that were placed on study in each group. Prior to necropsy, the animals were anesthetized with pentobarbital (60 mg/kg b.w., i. p.) and blood samples were collected via cardiac puncture after the body weight was recorded. Following euthanasia via exsanguination, all external surfaces, orifices, all organs, and the thoracic, abdominal and pelvic cavities were examined for gross lesions.

During necropsy the following tissues were weighed: brain, liver, spleen, kidneys, adrenals, lungs, thymus, testes w/epididymides, ovaries, and heart.

The following tissues were harvested from each animal and preserved in 10% neutral buffered formalin:

skin	colon	esophagus
mandibular and	cecum	stomach
mesenteric lymph nodes	rectum	duodenum
mammary glands	liver	jejunum
thigh muscle	pancreas	tongue
sciatic nerve	spleen	salivary gland
sternum	kidneys	ileum
femur with marrow	adrenals	nasal cavity with turbinates
thymus	urinary bladder	brain
trachea	seminal vesicles	pituitary
lungs with bronchi	prostate	preputial or clitoral glands
heart and aorta	uterus	Zymbal's gland
thyroid	ovaries	spinal cord
parathyroids	testes, with epididymides	

Subsequently, these tissues were trimmed, processed and embedded in paraffin. Blocks were sectioned at 5 μ and slides were prepared and stained with hematoxylin and eosin. Selected kidney slides were also stained for alpha-2 μ -globulin using immunohistochemical techniques. A monoclonal antibody for alpha-2 μ -globulin was a gift from the Chemical Industry Institute of Toxicology (CIIT). The primary antibody was diluted 1:200. A protease digestion and normal horse serum block were applied and an anti-mouse secondary antibody was used. The chromagen used to visualize the reaction product was diaminobenzidine and the slides were counterstained with hematoxylin (Prophet, et al., 1992). All tissues were examined in the high dose and control groups of both sexes. The spleen, kidneys, lungs and liver were examined in the remaining groups.

Inflammatory and degenerative lesions were graded according to severity using a scale of one to four (minimal, mild, moderate or marked). Data were tabulated according to individual animal and summarized by group. In addition, the gross observations and microscopic diagnoses were correlated for each animal. Labcat histopathology software was used for data management. All tissue specimens, blocks and slides, raw data and final report will be placed in the U.S. EPA storage facility.

RESULTS

Food and Water Consumption

Overall food and water consumption data are listed in Table 1. The food consumption data show no significant differences amongst the female groups while the 60 and 300 mg/kg male groups were significantly decreased ($p \leq 0.05$). Water consumption was significantly increased ($p \leq 0.05$) in the 300 mg/kg group of both sexes.

Using the food consumption data, the average daily dose levels of TNB received by group is presented in Table 2.

Body Weights, Organ Weights and Weight Ratios

Organ weights (heart, brain, spleen, adrenals, thymus, ovaries/testes, kidneys, lungs and liver) are given in Table 3. Mean group values for organ to body weight ratios and terminal body weights are present in Table 4.

Significant decreases ($p \leq 0.05$) from control terminal body weights were noted in both sexes in the 300 mg/kg group. The remaining groups did not display any change.

Absolute organ weights were significantly decreased ($p \leq 0.05$) from controls in the 300 mg/kg dose group for the following: females- kidneys, lungs and thymus; males - liver, heart and spleen.

Organ weights as a percent of the total body weight were significantly ($p \leq 0.05$) different from controls for the following organs:

Brain - The 300 mg/kg dose female group had an increased value.

Spleen - The 300 mg/kg group of both sexes had a decreased value.

Hematology

Hematology analyses performed were total white blood cell count (WBC), platelet count, red blood count (RBC), methemoglobin, hemoglobin, hematocrit, reticulocytes, Heinz bodies, MCV, MCH, MCHC and differential leukocyte count. Group data are summarized in Tables 5 and 6.

No significant ($p \leq 0.05$) differences were noted between the treated groups and the control group in either sex for any of the parameters tested except for the following:

- a) MCH was decreased in the 300 mg/kg group of both sexes and the 60 mg/kg female group.
- b) Platelets were increased in the 300 mg/kg female group.
- c) MCV was decreased in the 300 mg/kg male group.
- d) Methemoglobin was increased in the 300 mg/kg group of both sexes.

Clinical Chemistry

The following analytes were evaluated: glucose, BUN, creatinine, alkaline phosphatase, total protein, albumin, calcium, total bilirubin, aspartate aminotransferase, alanine aminotransferase, sodium, potassium, phosphorus, cholesterol and triglycerides. The mean group values for each analyte are compiled in Tables 7 and 8.

There were no clinical chemistry parameters in treated groups which were significantly ($p \leq 0.05$) different from the control group except for the following:

- a) BUN, creatinine and calcium were increased in the 300 mg/kg female group.
- b) Total bilirubin was decreased in the 300 mg/kg male group.
- c) AST was decreased in the 5 mg/kg female group.

Clinical Observations (Appendix F)

There were no treatment related clinical observations. Nearly all observations noted during the study would be considered spontaneous age related changes. Monitoring for subclinical infections was done every six months during the study via serological profiles of sentinel animals. No significant titers were noted.

Ophthalmology Findings (Appendix G)

All animals used in this study were affected with mild corneal dystrophy prior to the initiation of the study and when examined at the termination of the study were affected with ocular abnormalities. In those animals affected with a cataract graded as severe, no posterior segment was visible. It is typical for a significant portion of rats of this age (2 years old) to be affected with cataracts as was apparent in this study. Also, cataracts will result in iritis through lens-induced-uveitis, an immune response to lens protein antigen. Iritis may also result in the ocular discharge observed in some of the rats.

Corneal dystrophy was a common finding in both sexes. It was present prior to study initiation and as expected had progressed in many animals. In some, it had resulted in keratitis and also likely accounts for the red ocular discharge observed. It would appear that all lesions in this study were distributed well and that a treatment-related ophthalmic effect was not observed.

Survival

The main causes for early deaths were mononuclear cell leukemia (MCL) and pituitary tumors for both sexes. In addition, animals with abscessed skin lesions were euthanized before the terminal sacrifice for humane reasons. The survival rate is as follows:

<u>Dose Group</u>	<u>Females</u>	<u>Males</u>
300 mg/kg	70/75	66/75
60 mg/kg	64/75	59/75
5 mg/kg	60/75	50/75
0 mg/kg	49/60	49/60

Survival amongst the treated groups was not significantly different from that of the controls except for the low dose males. This disparity was not deemed treatment related but considered a spurious finding.

Gross Pathology (Appendix H)

Gross pathological findings were distributed in a non-treatment related manner and can be attributed to aging in nearly all instances.

Histopathology (Appendix H)

All tissues were histopathologically examined in control and high dose animals of both sexes while the spleen, liver, lungs and kidneys were examined in the remainder of the groups along with all gross lesions.

Incidence levels of diagnosed neoplasms in all dose groups in this study did not exceed National Toxicology Program values noted in untreated control F-344 rats compiled from numerous studies (Haseman, et al., 1985).

Chronic progressive nephropathy (CPN), a spontaneous renal disease of the F-344 rat, was prominent in all groups (treated and control) with an increased severity noted in males. This progressive disease was characterized by renal tubules having an increased number of cells with more intense basophilic staining of the cytoplasm and nucleus while basement membranes in glomeruli and around tubules were thickened. Some dilated tubules with thickened basement membranes had multiple layers of regenerative epithelium while others had flattened atrophic epithelium. In addition, interstitial fibrosis and inflammatory infiltrates were prominent and protein casts filled dilated tubules. Glomeruli displayed increased mesangial proliferation with adhesions between the glomerular tuft and capsular wall and around the glomerulus. Some glomerular lesions demonstrated increased size and number of parietal cells of Bowman's capsule, dilated Bowman's space and small sclerotic glomerular tufts. Mineralization of basement membranes of interalveolar septa and intima of small blood vessels was evident in many animals and is usually linked to this chronic renal disease.

The other renal change which was significant in both sexes was the increased incidence of cortical tubular cytoplasmic/hyaline droplets in the 60 and 300 mg/kg dose groups. Some of these droplets were large and irregularly shaped but were more often spheroid and stained positive with Mallory's Heidenhain protein stain. A light cytoplasmic staining pattern was noted in the proximal tubular epithelium of both sexes using the immunohistochemical staining procedure for alpha-2 μ -globulin. This staining was diffuse and did not appear to be associated with droplets. Positive staining for alpha-2 μ -globulin was observed in some of the droplets located in the proximal tubular epithelium in both sexes in the 60 and 300 mg/kg groups. However, not all of the droplets stained positive for alpha-2 μ -globulin. A diagnosis alpha-2 μ -globulin nephropathy was not deemed appropriate since there was no significant increase in tubular cell necrosis, no presence of granular casts or linear papillary mineralization or increased tubular hyperplasia. Renal pigmentation (lipofuscin and/or hemosiderin) was evident in both the cytoplasm of renal tubules and interstitial areas in all groups with it being most striking in high dose animals.

Hyperplasia of hematopoietic cells, predominantly erythroid, was commonly observed in the spleen along with increased pigment (hemosiderin) deposition

within macrophages. Only the high dose group of both sexes had an increased incidence and severity when compared to controls. This same type of erythroid response was also noted in the femoral bone marrow in some high dose females. Increased serum concentrations of methemoglobin noted in the high dose animals was probably due to the increased production of the transformation product of oxyhemoglobin under the influence of TNB oxidation and is the probable initiating cause of the hematopoietic activity. Methemoglobin is derived from hemoglobin by conversion of iron from ferrous to the ferric valence; it is then incapable of transporting oxygen.

Hepatocellular necrosis, bile duct hyperplasia and peribiliary fibrosis occur spontaneously in aging rats and were frequently noted in this study. The latter was characterized by increased collagen around bile ducts; the trapped biliary epithelium showed both proliferative and degenerative changes. In addition, chronic inflammatory changes and infiltrates were also apparent. Various spontaneous hepatic foci of cellular alteration were evident in both sexes and in all groups at about the same incidence levels. However, females had a predominance of basophilic foci while eosinophilic foci were more prominent in males.

Mononuclear cell leukemia is one of the most common neoplasms of F-344 rats and can have an incidence level from 15-35% in untreated controls as was noted in this study except for the moderate incidence decrease in the 300 mg/kg group of both sexes. The most consistent histologic finding was a severely congested spleen with a diffuse infiltration of the sinusoids by a sheet of neoplastic mononuclear cells. The liver in these animals consistently had mononuclear cells within hepatic sinusoids with necrosis of individual hepatocytes and hypertrophy of other hepatocytes. Hemorrhage and necrosis involving the brain was also noted and can be directly related to massive infiltrates of MCL cells.

Degenerative myocardial disease was present at a high incidence level in both controls and high dose animals, which is not unusual in F-344 rats, with the severity being mildly increased in males. The etiology of this change is unknown but appeared as coagulative necrosis of myocardial fibers, which were deeply eosinophilic and hyalinized with pyknotic nuclei. Inflammatory cellular infiltrates were usually present along with fibrosis and mineralization.

Neoplasms of the pars distalis were obvious in all groups of both sexes at nearly the same frequency. These lesions are reported to be the second or third most common neoplasm in the laboratory rat and pituitary adenomas may have an incidence of 20-40% in F-344 rats. The precise cause of spontaneous neoplasms of the pars distalis is unknown but may be related to endocrine imbalances associated with aging.

Ductal and alveolar mammary gland dilatation was well demonstrated in many animals and is considered to be within the spectrum of normal age-related non-neoplastic changes. The term galactoceles was used for markedly dilated ducts, which were occasionally noted. Fibroadenomas are a common benign spontaneous neoplasm of the mammary gland of the F-344 rat. The incidence level can range up to 30% as was demonstrated in this study. Endometrial stromal polyps were common in all female groups and appeared solitary or multiple. These benign

growths can have an incidence of up to 37% in control groups in two year studies. Ovarian cysts of various types were also obvious and are a common finding in aging female F-344 rats.

The incidence of testicular interstitial cell adenomas was nearly 100%, which is what normally can be expected in two year studies involving F-344 male rats. Atrophy and degeneration of adjacent seminiferous tubules was apparent in all groups as a result of these large compressing benign neoplasms.

The remaining diagnoses as listed in the tables should be considered spontaneous age related changes in two year old F-344 rats.

CONCLUSIONS

Administration of 1,3,5-trinitrobenzene to Fischer 344 rats in the diet at dose levels of 5, 60 and 300 mg/kg for two years resulted in the following biologically significant findings:

1. There was no evidence of carcinogenicity in F-344 rats receiving 5, 60 or 300 mg/kg 1,3,5-trinitrobenzene in their diet in comparison to concurrent and historical controls.
2. Terminal body weights were significantly reduced in both sexes administered 300 mg/kg diet.
3. Increased splenic erythroid cell hyperplasia and pigment deposition along with elevated methemoglobin levels were present in both sexes administered 300 mg/kg diet. The regenerative anemia previously noted in the interim sacrifices appeared to be nearly fully compensated.
4. Cytoplasmic/hyaline renal tubular protein droplets were excessive in both sexes administered 60 and 300 mg/kg diet. BUN and creatinine levels were minimally increased in the female 300 mg/kg dose group while water consumption was increased in both sexes in this same group. Since there were no adverse renal effects caused by the droplets in the 60 mg/kg diet, they were not considered biologically significant in that group.
5. A no adverse effect level of 2.68 mg/kg b.w./day was established for 1,3,5-trinitrobenzene.

APPENDIX G
OPHTHALMOLOGY DATA

Ophthalmology Report

David A. Wilkie DVM, MS
Diplomate ACVO

Introduction

The following are results of ocular examinations. All ocular examinations were performed by a Board-Certified Veterinary Ophthalmologist.

Materials and Methods

A preliminary ophthalmic examination was performed on the eyes of all rats by Dr David Wilkie DVM, MS, Dip. ACVO. Examinations included:

1. Biomicroscopic examination, using a Zeiss HSO-10 biomicroscope, following dilation of the pupils with 1.0% tropicamide (Mydracyl®).
2. Indirect ophthalmoscopic examination, using a 30 diopter lens, following dilation of the pupils with 1.0% tropicamide (Mydracyl®).

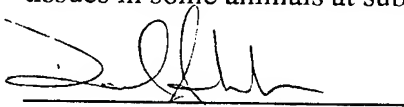

ResultsInitial Examination

The following animals were eliminated from study as a result of ocular abnormalities: 31, 90. Of the remaining test animals the following abnormalities were noted:

Normal	10, 103, 220, 246
Hyphema	90
Corneal dystrophy (crystals) - Moderate	31
Corneal dystrophy (crystals) - Mild	All Remaining Animals, including animal #90 were affected with mild corneal dystrophy OU

Conclusions

The above findings are compatible with breed and species associated ocular abnormalities. The animals eliminated from testing had either corneal dystrophy of severity greater than mild or hyphema. Except for animals 10, 103, 220, and 246, all of the animals remaining on test have mild corneal dystrophy affecting both eyes, a common finding in Fisher 344 rats of both sexes. In a chronic study such as this the corneal lesions will progress significantly and may interfere with examination of the intraocular tissues in some animals at subsequent examinations.

Date:

Introduction

The following are results of ocular examinations. All ocular examinations were performed by a Board-Certified Veterinary Ophthalmologist.

Materials and Methods

An final ophthalmic examination was performed on the eyes of all rats by Dr David Wilkie DVM, MS, Dip. ACVO prior to completion of the study. Examinations included:

1. Biomicroscopic examination, using a Zeiss HSO-10 biomicroscope, following dilation of the pupils with 1.0% tropicamide (Mydriacyl®).
2. Indirect ophthalmoscopic examination, using a 30 diopter lens, following dilation of the pupils with 1.0% tropicamide (Mydriacyl®).

Conclusions

All animals used in this study were affected with mild corneal dystrophy prior to the initiation of the study. All animals examined at the final examination were affected with ocular abnormalities. In those animals affected with a cataract graded as severe, no posterior segment was visible.

Corneal dystrophy is a common finding in Fisher 344 rats of both sexes. It was present prior to study initiation and as expected has progressed in many animals. In some, it has resulted in keratitis and also, likely accounts for the red ocular discharge observed.

Cataracts can be the result of aging, trauma from orbital bleeding or may be a treatment related effect. It is typical for a significant portion of rats of this age to be affected with cataracts. Also, cataracts will result in iritis through lens-induced-uveitis, an immune response to lens protein antigen. Iritis may also result in the ocular discharge observed.

As I am not aware of treatment groups, I cannot comment on the distribution of the lesions by treatment group, but it would appear that all lesions are distributed well and that a treatment-related ophthalmic effect was not observed in the animals on this study.

CORRELATION OF GROSS & MICRO

STUDY ID : 2 Year Study
FATE: ALL
DAYS ON TEST: ALL

STUDY NUMBER: 93-004
GROUP: 1
SEX: FEMALE

Animal ID: 27
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 729

Reference to Necropsy Record:

SKIN - Subcutaneous, Mass, 5x5x1 mm, Irregular, Firm,
Dark Red

Related Histopathology:

SKIN - Hemorrhage, Muscle

UTERUS - Left, Mass, 30x15x7 mm, Fluid Filled, Clear,
Dark Red

UTERUS - Endometrial Stromal Polyp

PANCREAS - Mass, 5x10x4 mm, Irregular, Firm, Tan

MESENTERY - Inflammation, Chronic; MESENTERY -
Mineralization, NOS; MESENTERY - Necrosis, Fat;
MESENTERY - Hemorrhage

PITUITARY - Mass, 4x5x1 mm, Irregular, Soft, Red

PITUITARY - Adenoma, Pars Distalis

Animal ID: 28
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 724

Reference to Necropsy Record:

PITUITARY - Mass, 2x2 mm, Round, Red

Related Histopathology:

PITUITARY - Adenoma, Pars Distalis

KIDNEY - Bilateral, Discoloration, Dark Brown

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Cytoplasmic Droplets; KIDNEY - Mineralization, NOS,
Medulla; KIDNEY - Pigmentation, NOS

Animal ID: 29
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 724

Reference to Necropsy Record:

KIDNEY - Bilateral, Discoloration, Dark Brown

Related Histopathology:

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Cytoplasmic Droplets; KIDNEY - Mineralization, NOS,
Medulla; KIDNEY - Pigmentation, NOS

PITUITARY - Mass, 4x2 mm, Oval, Black

PITUITARY - Adenoma, Pars Distalis

GROUP: 1
SEX: FEMALE

Animal ID: 30
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 728

Reference to Necropsy Record:

SKIN - Subcutaneous, Right Jaw, Mass, 15x12x10 mm,
Irregular, White

Related Histopathology:

ZYMBAL'S GLAND - Sebaceous Cell Adenoma

UTERUS - Right, Discoloration, Thickened Wall,
Brownish, Found at trimming

UTERUS - Endometrial Stromal Polyp

Animal ID: 31
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 728

Reference to Necropsy Record:

LIVER - Median Lobe, Focus, 5mm in diameter, Round,
Red

Related Histopathology:

LIVER - Bile Duct Hyperplasia; LIVER - Basophilic
Focus, Multiple; LIVER - Biliary Fibrosis; LIVER -
Inflammation, Chronic; LIVER - Congestion

UTERUS - Left Horn, Mass, 22x13x8 mm, Irregular, Soft,
Pink

UTERUS - Endometrial Stromal Polyp

Animal ID: 32
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 728

Reference to Necropsy Record:

SKIN - Subcutaneous, Masses, Irregular, Firm, Tan,
Under Left Front Leg, 34x28x17 mm, Under Left Rear
Leg, 19x15x7 mm

Related Histopathology:

MAMMARY GLAND - Fibroadenoma

KIDNEY - Bilateral, Discoloration, Dark Brown

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Cytoplasmic Droplets; KIDNEY - Mineralization, NOS,
Medulla; KIDNEY - Pigmentation, NOS

Chronic Bioassay of TNB in Fischer 344 Rats

CORRELATION OF GROSS & MICRO

STUDY ID : 2 Year Study

STUDY NUMBER: 93-004

FATE: ALL

GROUP: 4

DAYS ON TEST: ALL

SEX: FEMALE

Animal ID: 258

Pathologist: GRO

Animal Fate: Terminal Sacrifice

Days on Test: 724

Reference to Necropsy Record:

Related Histopathology:

SKIN - Subcutaneous, Rectal, Ventral, Herniation

SKIN - No Microscopic Observation

ADRENALS - Bilateral, Foci, 1 to 2mm in diameter, 1-3,
Round, Red

ADRENALS - Hyperplasia, NOS, Cortical

UTERUS - Enlarged, Moderate

UTERUS - Cystic Endometrial Glandular Hyperplasia

UTERUS - Bilateral, Mass, 4x4x4 mm, 2, Firm, Brown,
Found at trimming

UTERUS - Endometrial Stromal Polyp

Animal ID: 259

Pathologist: GRO

Animal Fate: Moribund Sacrifice

Days on Test: 604

Reference to Necropsy Record:

Related Histopathology:

SPLEEN - Enlarged, 75x20x11 mm

SPLEEN - Mononuclear Cell Leukemia

LUNGS - All Lobes, Discolored, Severe, Irregular, Red

LUNGS - Alveolar/Bronchiolar Hyperplasia; LUNGS -
Inflammation, Chronic/Active; LUNGS - Lymphocytic
Infiltrates; LUNGS - Hemorrhage; LUNGS - Congestion

STOMACH - Glandular, Foci, 5x6 mm, >5, Round, Black,
Found at trimming

STOMACH - Pigmentation, NOS, Glandular; STOMACH -
Necrosis, Glandular

Animal ID: 260

Pathologist: GRO

Animal Fate: Moribund Sacrifice

Days on Test: 703

Reference to Necropsy Record:

Related Histopathology:

SKIN - Subcutaneous, Mass, 50x41x30 mm, Oval, Firm,
Tan

MAMMARY GLAND - Fibroadenoma

PITUITARY - Mass, 5mm in diameter, Round, Black

PITUITARY - Carcinoma, Pars Distalis

Related Histopathology:

SKIN - Subcutaneous, Mass, 20x10x4 mm, Irregular,
Firm, White, Found at trimming

MAMMARY GLAND - Galactoceles

Animal ID: 261
Animal Fate: Found Dead

Pathologist: GRO
Days on Test: 624

Reference to Necropsy Record:

Related Histopathology:

PITUITARY - Mass, 10x5x5 mm

PITUITARY - Adenoma, Pars Distalis

BRAIN - Autolysis, Severe

BRAIN - Autolysis

Animal ID: 262
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 728

Reference to Necropsy Record:

Related Histopathology:

SPLEEN - Enlarged, 35x10x6 mm

SPLEEN - Mononuclear Cell Leukemia

OVARIES - Left, Cyst, 15x10x2 mm, Irregular, Yellow

OVARIES - Cyst, Parovarian

LIVER - Mottled, Mild

LIVER - Bile Duct Hyperplasia; LIVER - Necrosis,
Hepatocellular; LIVER - Biliary Fibrosis; LIVER -
Inflammation, Chronic; LIVER - Lymphocytic
Infiltrates; LIVER - Thrombus

PANCREAS - Mass, 1mm in diameter, Round, Tan

PERIPANCREATIC TISSUE - Mononuclear Cell Leukemia

Chronic Bioassay of TNB in Fischer 344 Rats

CORRELATION OF GROSS & MICRO

STUDY ID : 2 Year Study

STUDY NUMBER: 93-004

FATE: ALL

GROUP: 5

DAYS ON TEST: ALL

SEX: MALE

Animal ID: 337

Pathologist: GRO

Animal Fate: Terminal Sacrifice

Days on Test: 724

Reference to Necropsy Record:

Related Histopathology:

LUNGS - All Lobes, Foci, 1 to 2mm in diameter, >5,
Round, Red

LUNGS - Inflammation, Chronic/Active

TESTES - Bilateral, Masses, 1 to 5mm in diameter, >5,
Irregular, White

TESTES - Interstitial Cell Adenoma, Multiple

TESTES - Left, Decreased in size, 11x4x4 mm

TESTES - Degeneration, Seminiferous Tubule

ABDOMINAL CAVITY - Mass, 12x27x5 mm, Irregular, Firm,
Yellow, Found at trimming

ABDOMINAL CAVITY - Necrosis, Fat; ABDOMINAL CAVITY -
Mineralization, NOS, Fat; ABDOMINAL CAVITY -
Inflammation, Chronic

INTESTINAL TRACT - Gas filled

INTESTINAL TRACT - No tissue taken

Animal ID: 338

Pathologist: GRO

Animal Fate: Terminal Sacrifice

Days on Test: 727

Reference to Necropsy Record:

Related Histopathology:

KIDNEY - Bilateral, Discoloration, Dark Brown

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Cytoplasmic Droplets; KIDNEY - Mineralization, NOS,
Medulla; KIDNEY - Pigmentation, NOS

TESTES - Bilateral, Decreased in size, 2, (Right)
12x7x7 mm, (Left) 14x7x7 mm

TESTES - Degeneration, Seminiferous Tubule

PITUITARY - Mass, 9mm in diameter, Round, Dark Red

PITUITARY - Carcinoma, Pars Distalis

STOMACH - Foci, 2 to 3mm in diameter, 2, Black, Found
at trimming

STOMACH - No Corollary change detected

Reference to Necropsy Record:

TESTES - Bilateral, Masses, 1 to 5mm in diameter, >5,
Irregular, White

Related Histopathology:

TESTES - Interstitial Cell Adenoma, Multiple

Animal ID: 341
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 724

Reference to Necropsy Record:

KIDNEY - Bilateral, Pitted, Mild, Discoloration, Pale

Related Histopathology:

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Cytoplasmic Droplets; KIDNEY - Mineralization, NOS,
Medulla; KIDNEY - Pigmentation, NOS

PITUITARY - Mass, 6x5x4 mm, Round, Firm, Red

PITUITARY - Adenoma, Pars Distalis

TESTES - Bilateral, Masses, 1 to 5mm in diameter, >5,
Irregular, White

TESTES - Interstitial Cell Adenoma, Multiple

TESTES - Left, Decreased in size, Moderate

TESTES - Degeneration, Seminiferous Tubule

SKIN - Ear, Mass, 10mm in diameter, Round, Firm, Red

SKIN - Neural Crest Neoplasm (Ear)

Animal ID: 342
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 730

Reference to Necropsy Record:

KIDNEY - Bilateral, Pitted, Moderate

Related Histopathology:

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Cytoplasmic Droplets; KIDNEY - Mineralization, NOS,
Medulla; KIDNEY - Pigmentation, NOS

TESTES - Bilateral, Mass, 1 to 15mm in diameter, >5,
Irregular, Firm, Tan

TESTES - Interstitial Cell Adenoma, Multiple

CORRELATION OF GROSS & MICRO

STUDY ID : 2 Year Study
FATE: ALL
DAYS ON TEST: ALL

STUDY NUMBER: 93-004
GROUP: 6
SEX: MALE

Animal ID: 417
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 724

Reference to Necropsy Record:

LIVER - Median Lobe, 4mm in diameter, Round, Soft,
White

Related Histopathology:

LIVER - Hepatodiaphragmatic Nodule

TESTES - Bilateral, 1 to 5mm in diameter, >5, Round,
Firm, White

TESTES - Interstitial Cell Adenoma, Multiple

PITUITARY - Mass, 3x3x1 mm, Round, Red

PITUITARY - Hematocyst, Pars Distalis

Animal ID: 418
Animal Fate: Moribund Sacrifice

Pathologist: GRO
Days on Test: 553

Reference to Necropsy Record:

SPLEEN - Enlarged, 70x20x15 mm

Related Histopathology:

SPLEEN - Mononuclear Cell Leukemia

LIVER - Mottled, Tan and Brown

LIVER - Bile Duct Hyperplasia; LIVER - Biliary
Fibrosis; LIVER - Lymphocytic Infiltrates

ADRENALS - Bilateral, Enlarged, 5mm in diameter, 2

ADRENALS - Vacuolization, Cytoplasmic, Cortical

TESTES - Bilateral, Multiple Masses, 1 to 5mm in
diameter, >5, Irregular, White

TESTES - Interstitial Cell Adenoma, Multiple

BRAIN - Darkened areas, 1 to 2mm in diameter, >5,
Round, Black

BRAIN - Necrosis; BRAIN - Hemorrhage

Reference to Necropsy Record:

TESTES - Bilateral, Mass, 1 to 5mm in diameter, >5,
Irregular, Firm, White

Related Histopathology:

TESTES - Interstitial Cell Adenoma, Multiple

LIVER - Left Lobe, Focus, 8x4x3 mm, Irregular, Red

LIVER - Hemorrhage

Animal ID: 420
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 727

Reference to Necropsy Record:

KIDNEY - Bilateral, Pitted, Mild

Related Histopathology:

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Cytoplasmic Droplets; KIDNEY - Mineralization, NOS,
Medulla; KIDNEY - Pigmentation, NOS

TESTES - Bilateral, Masses, 1 to 10mm in diameter, >5,
Irregular, Firm, Tan

TESTES - Interstitial Cell Adenoma, Multiple

Animal ID: 422
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 730

Reference to Necropsy Record:

TESTES - Bilateral, Mass, 1 to 7mm in diameter, >5,
Irregular, Firm, White

Reference to Necropsy Record:

PITUITARY - Mass, 6x6x5 mm, Irregular, Red

KIDNEY - Bilateral, Pitted

TESTES - Bilateral, Masses, 1 to 5mm in diameter, >5,
Round, White

TESTES - Right, Decreased in size, Severe

MESENTERY - Masses, 20x10x5 mm, 10x5x2 mm, 2,
Irregular, Soft, Yellow

LIVER - Mottled, Mild, Red

Related Histopathology:

PITUITARY - Adenoma, Pars Distalis

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Cytoplasmic Droplets; KIDNEY - Pigmentation, NOS

TESTES - Interstitial Cell Adenoma, Multiple

TESTES - Degeneration, Seminiferous Tubule

MESENTERY - Lipoma; MESENTERY - Inflammation, Chronic/
Active, Fat

LIVER - Bile Duct Hyperplasia; LIVER - Eosinophilic
Focus, Multiple; LIVER - Vacuolization,
Hepatocellular; LIVER - Biliary Fibrosis

Animal ID: 425

Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 724

Reference to Necropsy Record:

KIDNEY - Bilateral, Pitted, Mild, Pale

TESTES - Bilateral, Masses, 1 to 5mm in diameter, >5,
Round, Firm, White, Left, Enlarged

SEMINAL VESICLES - Decrease in size, Moderate

LIVER - Median Lobe, Foci, Round, 2, 2mm in diameter,
Red, 1mm in diameter, White

LIVER - Left Lobe, Focus, 3mm in diameter, Round, Red

PITUITARY - Focus, 3mm in diameter, Round, Red

Related Histopathology:

KIDNEY - Chronic Progressive Nephropathy

TESTES - Interstitial Cell Adenoma, Multiple

SEMINAL VESICLES - Atrophy, NOS

LIVER - Eosinophilic Focus, Multiple

LIVER - Eosinophilic Focus, Multiple

PITUITARY - Hyperplasia, NOS, Pars Distalis

Animal Fate: Moribund Sacrifice

Pathologist: GRO
Days on Test: 686

Reference to Necropsy Record:
SKIN - Mass, 50x35x25 mm, Round, Soft, Red

Related Histopathology:
SKIN - Fibroma

SKIN - Mass, 10x8x3 mm, Irregular, Hard, Tan

SKIN - Keratoacanthoma

LYMPH NODE - Enlarged, Irregular, White

MAMMARY GLAND - Galactocoele, Multiple

SPLEEN - Enlarged, 55x15x5 mm

SPLEEN - Mononuclear Cell Leukemia

LIVER - All Lobes, Mottled

LIVER - Bile Duct Hyperplasia; LIVER - Biliary
Fibrosis; LIVER - Lymphocytic Infiltrates

STOMACH - Glandular, Foci, 2 to 7mm in diameter, >5,
Round, Black, Found at trimming

STOMACH - Pigmentation, NOS, Glandular

FATE: ALL
DAYS ON TEST: ALL

STUDY NUMBER: 93-004
GROUP: 8
SEX: MALE

Animal ID: 556
Animal Fate: Moribund Sacrifice

Pathologist: GRO
Days on Test: 686

Reference to Necropsy Record:

Related Histopathology:

INTESTINAL TRACT - Bloated

INTESTINAL TRACT - No tissue taken

Animal ID: 557
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 730

Reference to Necropsy Record:
SPLEEN - Enlarged, 47x12x5 mm

Related Histopathology:
SPLEEN - Hyperplasia, Erythroid Cell

LIVER - Left Lobe, Foci, 3mm in diameter, Round,
Clear

LIVER - Degeneration, Cystic

TESTES - Bilateral, Masses, 1 to 5mm in diameter, >5,
Irregular, White

TESTES - Interstitial Cell Adenoma, Multiple

Animal ID: 560
Animal Fate: Found Dead

Pathologist: GRO
Days on Test: 713

Reference to Necropsy Record:

Related Histopathology:

THYROID - Right, or Parathyroid, Enlarged, 7x5x5 mm,
Round, Found at trimming

THYROID - Carcinoma, NOS

ADRENALS - Right, Enlarged, 10mm in diameter, Round,
Found at trimming

ADRENALS - Pheochromocytoma

TESTES - Bilateral, Masses, 1 to 5mm in diameter, >5,
Irregular; Left, Enlarged, 28x18x12 mm, Found at
trimming

TESTES - Interstitial Cell Adenoma, Multiple

Days on Test: 724

Reference to Necropsy Record:

TESTES - Bilateral, Masses, >5, Dark Red, White,
(Right) 25x15x10 mm; (Left) 20x10x7 mm

Related Histopathology:

TESTES - Interstitial Cell Adenoma, Multiple

LIVER - All Lobes, Mottled

LIVER - Bile Duct Hyperplasia; LIVER - Biliary
Fibrosis; LIVER - Eosinophilic Focus

PITUITARY - Mass, 3x6x1 mm, Dark Red

PITUITARY - Adenoma, Pars Distalis; PITUITARY -
Hematocyst

TESTES - Left, Decreased in size, 15x6x6 mm

TESTES - Degeneration, Seminiferous Tubule

Animal ID: 562
Animal Fate: Terminal Sacrifice

Pathologist: GRO
Days on Test: 727

Reference to Necropsy Record:

SKIN - Subcutaneous, Chest, Mass, 29x17x10 mm,
Irregular, Firm, White

Related Histopathology:

SKIN - Fibroma

TESTES - Masses, 1 to 5mm in diameter, >5, Irregular,
Firm, White; Right, Enlarged, 30x18x15 mm

TESTES - Interstitial Cell Adenoma, Multiple

KIDNEY - Pitted, Mild

KIDNEY - Chronic Progressive Nephropathy; KIDNEY -
Mineralization, NOS, Medulla; KIDNEY - Pigmentation,
NOS

THYROID - Left, Mass, 9x6x5 mm, Irregular, Firm, Tan,
Red

THYROID - Follicular Cell Carcinoma

(END OF REPORT)

APPENDIX I

CHEMICAL ANALYSES

Determination of Homogeneity
of 1,3,5-Trinitrobenzene in the Diet

Target Diet Concentration (mg/kg)	Site of Sampling	Concentration by Analysis (mg/kg)	Mean Concentration (mg/kg)	Deviation from Mean (%)
WEEK 1				
300	Top	272	279	2.52
	Middle	283		1.23
	Bottom	283		1.29
60	Top	55.4	55.6	0.35
	Middle	54.3		2.37
	Bottom	57.1		2.72
5	Top	5.26	5.03	4.48
	Middle	4.79		4.73
	Bottom	5.04		0.25
WEEK 2				
300	Top	301	304	1.00
	Middle	299		1.54
	Bottom	312		2.55
60	Top	61.4	61.6	0.33
	Middle	63.1		2.50
	Bottom	60.2		2.17
5	Top	5.47	5.39	1.47
	Middle	5.14		4.67
	Bottom	5.57		3.19

Determination of Homogeneity
of 1,3,5-Trinitrobenzene in the Diet

Target Diet Concentration (mg/kg)	Site of Sampling	Concentration by Analysis (mg/kg)	Mean Concentration (mg/kg)	Deviation from Mean (%)
WEEK 3				
300	Top	280	276	1.19
	Middle	277		0.23
	Bottom	272		1.42

13. ABSTRACT Chronic toxic effects of 1,3,5-trinitrobenzene (TNB) in male and female Fischer rats were evaluated by feeding certified powdered laboratory chow diet supplemented with varied concentrations of TNB (0, 5, 60 and 300 mg/kg diet). This report discusses the ninety day sacrifice findings of this two year study. Food intake in all female groups was significantly reduced while terminal body weights were reduced in both sexes in high dose animals. The calculated average TNB consumption for females was 0.35, 3.72 and 17.93 mg/kg/day and 0.27, 3.21 and 15.17 mg/kg/day for males. An increase in the relative spleen weight of both sexes in the 300 mg/kg dose group was noted along with an increase in the 60 mg/kg female group. Relative kidney weights were increased in the 300 mg/kg dose group of both sexes while the relative brain (males), lungs (females) and liver (females) weights were elevated in this same dose group. Methemoglobin levels were increased in the 60 and 300 mg/kg groups of both sexes. Histopathological examinations suggested that the susceptible organs for TNB toxicity were kidneys (excessive hyaline droplets) in the 60 and 300 mg/kg male groups and the spleen (erythroid cell hyperplasia) in both sexes in these same dose groups.

Study Personnel

Study Director: Tirumuru Reddy, Ph.D.

Study Coordinator/Biochemist: Barry Wiechman, B.S., M.S.

Pathologist: Greg Olson, D.V.M., Ph.D.

Ophthalmologist: David Wilkie, D.V.M., M.S.

Biostatistician: Joni Torsella, Ph.D.

Study Biological Technician: Bradley Peterson, A.S.

Histology Laboratory Supervisor: Sheree Lovelace, A.S.

Study Timetable:

Study Initiation: August 17, 1993

Initiation of Dosing: August 30, 1993

Interim Necropsy: November 30 and December 1, 1993

INTRODUCTION

Nitroaromatics, such as 1,3-dinitrobenzene (DNB), 1,3,5-trinitrobenzene (TNB), and N-methyl-N,2,4,6-tetranitroaniline (tetryl), have been detected as environmental contaminants of groundwater and soil near production sites and in some instances at military test grounds. TNB is formed as a by-product during 2,4,6-trinitrotoluene (TNT) production and can be formed through photochemical oxidative degradation of 2,4-dinitrotoluene a by-product released into the environment from TNT manufacturing (Burlinson, 1980; Spanggord et.al., 1982). TNB is not easily biodegradable, persists in the environment, eventually leaches out, and contaminates groundwater near waste disposal sites (Garman et.al., 1987). Exposure to TNB can occur through contact with wastewaters and soil at the original production sites and other plants devoted to munitions assembly which contain large quantities of these nitroaromatic compounds (Walsh and Jenkins, 1992).

Toxicity data on these compounds are limited. The oral LD₅₀ of DNB, TNB and tetryl were 59 mg/kg, 284 mg/kg and greater than 5 g/kg, respectively, in rats for combined sexes. TNB and tetryl were not toxic at 2 g/kg when applied to rabbit skin for 24 hours. However, the dermal LD₅₀ of DNB was 1.99 g/kg for combined sexes of rabbits. None of these compounds produced skin irritation but positive (DNB) and severe (TNB, tetryl) eye irritation potentials in rabbits were noted. The sensitization tests showed that DNB and tetryl are not skin sensitizers while TNB caused mild allergic reaction in guinea pigs (Fitzgerald et. al., 1992 a,b,c). Some of the toxicological effects of TNB are: formation of methemoglobin, testicular degeneration and reproductive failure, weight loss and anemia in hamsters, rats and mice. Neurological and hematological disorders have also been reported in dogs. DNB is toxic to humans; the estimated lethal dose range is 5-50 mg/kg and is readily absorbed through the skin (Von Burg, 1989). Tetryl was observed to be a powerful skin sensitizer in ammunition plant workers with dermatitis, liver atrophy, spleen effects, headaches, weight loss and respiratory irritation reported following exposure (U.S. EPA, 1990). Atmospheric concentration of 1.5 mg/m³ or below did not produce systemic poisoning in persons working with tetryl. DNB, TNB and tetryl have been shown to be genotoxic in the Salmonella mutagenesis assay (McGregor et. al., 1989) while TNB and DNB have been shown to form adducts of blood proteins and tissue DNA in rats (Reddy et. al.; 1991, 1995).

Objective of the Study

This study was conducted in order to evaluate the toxicity of 1,3,5-trinitrobenzene when administered in the diet for a two year period.

MATERIALS AND METHODS

Test Material Preparation

1,3,5-Trinitrobenzene powder (CAS #99-35-4) was supplied by the U.S. Army Biomedical Research and Development Laboratory. Analysis by HPLC revealed no detectable impurities. Certified powdered Purina Laboratory Chow 5002 was purchased (Ralston-Purina Co., St. Louis, MO) and stored at 4°C until used. First, 0.3 g of TNB was added to 50 g of powdered diet in a mortar and thoroughly ground with a pestle. Afterwards 250 g of the diet was added and mixed for 15 minutes followed by 350 g and mixed for an additional 15 minutes. Finally, the remaining diet (350 g) was added and mixed for 30 minutes in a mechanical mixer (Kitchen Aid, St. Joseph, MI) for uniform distribution of TNB in the diet. This was verified by determining the TNB concentration in the diet, taken from each of the 1 kg mixtures, by quantitative analysis done by HPLC. The premixed diet (0.3 g/kg) was further diluted with fresh powdered diet to obtain the desired TNB concentration in the lower dose groups. The diet feeders were changed twice a week.

Analyses of the TNB-feed mixtures were carried out on acetone extracts of the mixtures, utilizing a Waters 600E chromatography system (Waters, Milford, MA), equipped with a 490E programmable multiwavelength detector, operating at 245 nm. The entire chromatography system was interfaced with a Berthold HPLC computer program, Version 1.65 (Berthold, Nashua, NH). The TNB was eluted from a Zorbax C-8 column (9.4 mm x 25 cm) (MAC-DOD Analytical, Chadds Ford, PA) with a water-methanol gradient, at a flow rate of 3 ml/min. Working standards were prepared in Burdick and Jackson HPLC grade high purity methanol (Baxter, Oletz, OH).

Animals and Maintenance

Male and female Fischer 344 rats, confirmed free of viral antibodies, bacteria and parasites, were obtained from Charles River Laboratories, Kingston, New York. The animals, 7-8 weeks old and weighing approximately 140-175 g when delivered, were held for 1 week in quarantine prior to initiation of treatment. The animals were housed in a temperature (22-23°C) and humidity (40-60%) controlled room on a 12:12 hour light:dark cycle. For the study, they were housed individually in polycarbonate cages and water was administered ad libitum. Animal identification was done using electronic implants (Bio Medic, Maywood, NJ) with the rats assigned to control and treatment groups according to a computer-generated set of random numbers. The weight variation of the animals of each sex used did not exceed ± 2 s.d. of the mean weight at the time of delivery. The cages were identified with a color-coded identification card indicating the animal and treatment group. All aspects of the study were conducted in compliance with the guidelines of the American Association for Accreditation of Laboratory Animal Care.

All rats were observed daily for physiological and behavioral responses as well as for mortality or morbidity. Food and water consumption were recorded twice weekly. Body weights were taken prior to the start of the study, once weekly during the study and at the final sacrifice.

Experiment Groups

Group	Interim Sac. No. of Animals	Sex	mg TNB/kg diet
1	10	F	300
2	10	F	60
3	10	F	5
4	10	F	0
5	10	M	300
6	10	M	60
7	10	M	5
8	10	M	0

Hematology and Clinical Chemistry

Hematology parameters were assessed using a Serono-Baker Hematology Analyzer, Model 9000 (Serono-Baker, Allentown, PA). Total red and white blood cell counts, platelet count, differential leukocyte count, hemoglobin, packed cell volume, reticulocytes, MCV, MCH, MCHC and Heinz bodies were measured and computed. Methemoglobin samples were analyzed on a IL 482 Co-Oximeter.

Clinical chemistry was performed using a COBAS Fara II centrifugal analyzer (Roche, Nutley, NJ) with a non-selective electrode module. Clinical chemistry analytes included sodium, potassium, total protein, albumin, calcium, phosphorus, total bilirubin, blood urea nitrogen, creatinine, alanine aminotransferase, aspartate aminotransferase, glucose and alkaline phosphatase.

Statistical Evaluation

Males and females were considered separately in all statistical analyses. A one-factor (dose) analysis of variance (ANOVA) was used to analyze normally distributed measures: body weights, organ weights, organ weight ratios, food and water consumption, hematology and clinical chemistry. When a treatment effect was noted ($p \leq 0.05$, F-test) the difference between the control and the treatment groups was probed using a multiple comparison procedure (Dunnett's or Tukey's test). Due to the high variability of some of the measures, a nonparametric analysis of variance, the Wilcoxon Rank Sum Test, was used where appropriate.

Necropsy and Histopathology

Prior to necropsy, the animals were anesthetized with pentobarbital (60 mg/kg b.w., i. p.) and blood samples were collected via cardiac puncture after the body weight was recorded. Following euthanasia via exsanguination, all external surfaces, orifices, all organs, and the thoracic, abdominal and pelvic cavities were examined for gross lesions.

During necropsy the following tissues were weighed: brain, liver, spleen, kidneys, adrenals, lungs, thymus, testes w/epididymides, ovaries, and heart.

The following tissues were harvested from each animal and preserved in 10% neutral buffered formalin:

skin	colon
mandibular and	cecum
mesenteric lymph nodes	rectum
mammary glands	liver
thigh muscle	pancreas
sciatic nerve	spleen
sternum	kidneys
femur with marrow	adrenals
thymus	urinary bladder
trachea	seminal vesicles
lungs with bronchi	prostate
heart and aorta	testes, including epididymides
thyroid	ovaries
parathyroids	uterus
esophagus	nasal cavity with turbinates
stomach	brain
duodenum	pituitary
jejunum	preputial or clitoral glands
tongue	Zymbal's gland
salivary gland	spinal cord
ileum	

Subsequently, these tissues were trimmed, processed and embedded in paraffin. Blocks were sectioned at 5 μ and slides were prepared and stained with hematoxylin and eosin. All tissues were examined in the high dose and control groups of both sexes. The spleen, kidneys, lungs and liver were examined in the remaining groups.

Inflammatory and degenerative lesions were graded according to severity using a scale of one to four (minimal, mild, moderate or marked). Data were tabulated according to individual animal and summarized by group. In addition, the gross observations and microscopic diagnoses were correlated for each animal. Labcat histopathology software was used for data management.

RESULTS

Food and Water Consumption

Overall food and water consumption data are listed in Table 1. The food consumption data shows a significant decrease ($p \leq 0.05$) in all female groups but not in any of the male groups. Water consumption was not significantly changed in females while the 60 and 300 mg/kg male groups were marginally increased.

Using the food consumption data, the average daily dose levels of TNB received by group is presented in Table 2.

Body Weights, Organ Weights and Weight Ratios

Organ weights (heart, brain, spleen, adrenals, thymus, ovaries/testes, kidneys, lungs and liver) are given in Tables 3 (females) and 4 (males). Mean group values for organ to body weight ratios are present in Tables 5 (females) and 6 (males).

Significant decreases ($p \leq 0.05$) from control terminal body weights were noted in both sexes in the 300 mg/kg group and the 60 mg/kg female group. The remaining groups did not display any changes.

Absolute organ weights were significantly ($p \leq 0.05$) different from controls for the following:

- Kidneys - The 60 mg/kg male group was increased.
- Ovaries - The 5 mg/kg female group was increased.
- Spleen - The 300 mg/kg group of both sexes was increased along with the 60 mg/kg female group.
- Thymus - The 300 mg/kg male group was decreased.

Organ weights as a percent of the total body weight were significantly ($p \leq 0.05$) different from controls for the following:

- Brain - The 300 mg/kg male group had an increased value.
- Spleen - The 300 mg/kg groups of both sexes had increased values along with the 60 mg/kg female group.
- Liver - The 300 mg/kg female group had an increased value.
- Lungs - Increased values were present in the 300 and 60 mg/kg female groups.
- Kidneys - The 300 mg/kg group of both sexes had increased values.
- Ovaries - The 5 mg/kg group had an increased value.

Hematology

Hematology analyses performed were total white blood cell count (WBC), platelet count, red blood cell count (RBC), methemoglobin (MetHb), hemoglobin, hematocrit, reticulocytes, Heinz bodies, MCV, MCH, MCHC, and differential leukocyte count. Group data are summarized in Tables 7 and 8. There were no significant ($p \leq 0.05$) differences between the treated groups and the control group for any of the analytes except for the following:

1. RBC: A decrease in total red cell count in the 60 and 300 mg/kg female groups and in the 300 mg/kg male group.
2. Hemoglobin: A decrease in the 60 and 300 mg/kg groups of both sexes.
3. Hematocrit: A decrease in the 60 and 300 mg/kg female groups in addition to the 300 mg/kg male group.
4. Platelets: An increase in both sexes in the 300 mg/kg group.
5. Reticulocytes: An increase in reticulocytes in both sexes in the 300 mg/kg group.
6. Methemoglobin: An increase in both sexes in the 60 and 300 mg/kg groups.
7. MCV: An increase in the 60 and 300 mg/kg male groups.
8. MCHC: A decrease in the 300 mg/kg female group only.

Clinical Chemistry

The following analytes were evaluated: glucose, blood urea nitrogen (BUN), creatinine, alkaline phosphatase (ALK phos), total protein, albumin, calcium, total bilirubin, aspartate aminotransferase (AST), alanine aminotransferase (ALT), sodium, potassium, and phosphorus. The mean group values for each analyte are compiled. The mean group values for each analyte are compiled in Tables 9 - 10. There were no significant ($p \leq 0.05$) differences between the control and treated groups for any of the analytes except for the following:

1. Blood Urea Nitrogen: An increase in the male 300 mg/kg group.
2. Alkaline Phosphatase: A decrease in the 60 mg/kg male group.

Clinical Observations

There were no clinical observations that were treatment related.

Survival

There were no early deaths in any of the groups.

Gross Pathology

There were no treatment related gross observations present.

Histopathology

All tissues were histopathologically examined in control and high dose animals of both sexes while the spleen, liver, lungs and kidneys were examined in the remainder of the groups.

The kidneys of male rats in the 60 and 300 mg/kg dose groups exhibited an increased incidence of cortical tubular hyaline droplet deposition. Some of these droplets were large and irregular, resulting in a mild increase in tubular degeneration with a compensatory increase in tubular regeneration.

The spleen and bone marrow both featured minimal to mild erythroid cell hyperplasia with increased pigment deposition. This was evident in both sexes in the 300 mg/kg group. This same compensatory change (regenerative anemia) can be noted in multiple organs but only the spleen was examined in all the animals.

The remaining diagnoses as listed in the tables should be considered spontaneous for F-344 rats since their incidence or severity levels were low.

CONCLUSIONS

Administration of 1,3,5-trinitrobenzene in the diet to Fischer 344 rats at various doses for ninety days resulted in the following biologically significant findings:

1. The relative organ weights of the spleen, liver, lungs and kidneys were increased in females administered 300 mg/kg while in males in this same group the spleen, brain and kidneys were increased. In the 60 mg/kg female group the spleen and lungs were increased.
2. Hemoglobin, hematocrit and red blood cell count were decreased in both sexes in the 300 mg/kg group while in the 60 mg/kg group these parameters were decreased in females but only the hemoglobin level was decreased in males.
3. Methemoglobin levels were increased in both sexes in the 60 and 300 mg/kg groups.
4. Erythroid cell hyperplasia was increased in the 300 mg/kg group of both sexes.
5. Excessive hyaline droplet deposition was apparent in cortical renal tubules of male rats in the 60 and 300 mg/kg groups.
6. Terminal body weights were reduced in both sexes in the 300 mg/kg group and the 60 mg/kg female group.
7. Food consumption was reduced in the 5, 60 and 300 mg/kg female groups while water consumption was increased in the 60 and 300 mg/kg male groups.

13. ABSTRACT Chronic toxic effects of 1,3,5-trinitrobenzene (TNB) in male and female Fischer rats were evaluated by feeding certified powdered laboratory chow diet supplemented with varied concentrations of TNB (0, 5, 60 and 300 mg/kg diet). This report discusses the six month findings of this two year study. Food intake was significantly reduced in the 300 mg/kg dose group of both sexes while terminal body weights were reduced in females only in this same dose group. The calculated average TNB consumption for females was 0.27, 3.23 and 14.37 mg/kg/day and 0.28, 3.22 and 15.69 mg/kg/day for males. An increase in the relative spleen weight of both sexes in the 300 mg/kg dose group was noted along with an increase in methemoglobin formation. Relative liver weights was increased in the 300 mg/kg dose group of both sexes while the relative kidney weight was increased in males only in this same dose group. Hematology data indicated an elevated WBC count in both sexes in the 300 mg/kg dose group while the RBC count was reduced in all male dose groups and the 300 mg/kg female group. Hemoglobin, hematocrit, platelets and reticulocytes were also altered when compared to controls. Histopathological examinations suggested that the susceptible organs for TNB toxicity were kidneys (excessive hyaline droplets) and spleen (erythroid cell hyperplasia) in the 60 and 300 mg/kg groups.

Study Initiation: August 17, 1993

Initiation of Dosing: August 30, 1993

Interim Necropsy: March 1 and 2, 1994

INTRODUCTION

Nitroaromatics, such as 1,3-dinitrobenzene (DNB), 1,3,5-trinitrobenzene (TNB), and N-methyl-N,2,4,6-tetranitroaniline (tetryl), have been detected as environmental contaminants of groundwater and soil near production sites and in some instances at military test grounds. TNB is formed as a by-product during 2,4,6-trinitrotoluene (TNT) production and can be formed through photochemical oxidative degradation of 2,4-dinitrotoluene a by-product released into the environment from TNT manufacturing (Burlinson, 1980; Spanggord et.al., 1982). TNB is not easily biodegradable, persists in the environment, eventually leaches out, and contaminates groundwater near waste disposal sites (Garman et.al., 1987). Exposure to TNB can occur through contact with wastewaters and soil at the original production sites and other plants devoted to munitions assembly which contain large quantities of these nitroaromatic compounds (Walsh and Jenkins, 1992).

Toxicity data on these compounds are limited. The oral LD₅₀ of DNB, TNB and tetryl were 59 mg/kg, 284 mg/kg and greater than 5 g/kg, respectively, in rats for combined sexes. TNB and tetryl were not toxic at 2 g/kg when applied to rabbit skin for 24 hours. However, the dermal LD₅₀ of DNB was 1.99 g/kg for combined sexes of rabbits. None of these compounds produced skin irritation but positive (DNB) and severe (TNB, tetryl) eye irritation potentials in rabbits were noted. The sensitization tests showed that DNB and tetryl are not skin sensitizers while TNB caused mild allergic reaction in guinea pigs (Fitzgerald et. al., 1992 a,b,c). Some of the toxicological effects of TNB are: formation of methemoglobin, testicular degeneration and reproductive failure, weight loss and anemia in hamsters, rats and mice. Neurological and hematological disorders have also been reported in dogs. DNB is toxic to humans; the estimated lethal dose range is 5-50 mg/kg and is readily absorbed through the skin (Von Burg, 1989). Tetryl was observed to be a powerful skin sensitizer in ammunition plant workers with dermatitis, liver atrophy, spleen effects, headaches, weight loss and respiratory irritation reported following exposure (U.S. EPA, 1990). Atmospheric concentration of 1.5 mg/m³ or below did not produce systemic poisoning in persons working with tetryl. DNB, TNB and tetryl have been shown to be genotoxic in the Salmonella mutagenesis assay (McGregor et. al., 1989) while TNB and DNB have been shown to form adducts of blood proteins and tissue DNA in rats (Reddy et. al.; 1991, 1995).

Objective of the Study

This study was conducted in order to evaluate the toxicity of 1,3,5-trinitrobenzene when administered in the diet for a two year period.

MATERIALS AND METHODS

Test Material Preparation

1,3,5-Trinitrobenzene powder (CAS #99-35-4) was supplied by the U.S. Army Biomedical Research and Development Laboratory. Analysis by HPLC revealed no detectable impurities. Certified powdered Purina Laboratory Chow 5002 was purchased (Ralston-Purina Co., St. Louis, MO) and stored at 4°C until used. First, 0.3 g of TNB was added to 50 g of powdered diet in a mortar and thoroughly ground with a pestle. Afterwards 250 g of the diet was added and mixed for 15 minutes followed by 350 g and mixed for an additional 15 minutes. Finally, the remaining diet (350 g) was added and mixed for 30 minutes in a mechanical mixer (Kitchen Aid, St. Joseph, MI) for uniform distribution of TNB in the diet. This was verified by determining the TNB concentration in the diet, taken from each of the 1 kg mixtures, by quantitative analysis done by HPLC. The premixed diet (0.3 g/kg) was further diluted with fresh powdered diet to obtain the desired TNB concentration in the lower dose groups. The diet feeders were changed twice a week.

Analyses of the TNB-feed mixtures were carried out on acetone extracts of the mixtures, utilizing a Waters 600E chromatography system (Waters, Milford, MA), equipped with a 490E programmable multiwavelength detector, operating at 245 nm. The entire chromatography system was interfaced with a Berthold HPLC computer program, Version 1.65 (Berthold, Nashua, NH). The TNB was eluted from a Zorbax C-8 column (9.4 mm x 25 cm) (MAC-DOD Analytical, Chadds Ford, PA) with a water-methanol gradient, at a flow rate of 3 ml/min. Working standards were prepared in Burdick and Jackson HPLC grade high purity methanol (Baxter, Oletz, OH).

Animals and Maintenance

Male and female Fischer 344 rats, confirmed free of viral antibodies, bacteria and parasites, were obtained from Charles River Laboratories, Kingston, New York. The animals, 7-8 weeks old and weighing approximately 140-175 g when delivered, were held for 1 week in quarantine prior to initiation of treatment. The animals were housed in a temperature (22-23°C) and humidity (40-60%) controlled room on a 12:12 hour light:dark cycle. For the study, they were housed individually in polycarbonate cages and water was administered ad libitum. Animal identification was done using electronic implants (Bio Medic, Maywood, NJ) with the rats assigned to control and treatment groups according to a computer-generated set of random numbers. The weight variation of the animals of each sex used did not exceed ± 2 s.d. of the mean weight at the time of delivery. The cages were identified with a color-coded identification card indicating the animal and treatment group. All aspects of the study were conducted in compliance with the guidelines of the American Association for Accreditation of Laboratory Animal Care.

All rats were observed daily for physiological and behavioral responses as well as for mortality or morbidity. Food and water consumption were recorded twice weekly. Body weights were taken prior to the start of the study, once weekly during the study and at the final sacrifice.

Experiment Groups

Group	Interim Sac. No. of Animals	Sex	mg TNB/kg diet
1	10	F	300
2	10	F	60
3	10	F	5
4	10	F	0
5	10	M	300
6	10	M	60
7	10	M	5
8	10	M	0

Hematology and Clinical Chemistry

Hematology parameters were assessed using a Serono-Baker Hematology Analyzer, Model 9000 (Serono-Baker, Allentown, PA). Total red and white blood cell counts, platelet count, differential leukocyte count, hemoglobin, packed cell volume, reticulocytes, MCV, MCH, MCHC and Heinz bodies were measured and computed. Methemoglobin samples were analyzed on a IL 482 Co-Oximeter.

Clinical chemistry was performed using a COBAS Fara II centrifugal analyzer (Roche, Nutley, NJ) with a non-selective electrode module. Clinical chemistry analytes included sodium, potassium, total protein, albumin, calcium, phosphorus, total bilirubin, blood urea nitrogen, creatinine, alanine aminotransferase, triglycerides, aspartate aminotransferase, glucose and alkaline phosphatase.

Statistical Evaluation

Males and females were considered separately in all statistical analyses. A one-factor (dose) analysis of variance (ANOVA) was used to analyze normally distributed measures: body weights, organ weights, organ weight ratios, food and water consumption, hematology and clinical chemistry. When a treatment effect was noted ($p \leq 0.05$, F-test) the difference between the control and the treatment groups was probed using a multiple comparison procedure (Dunnett's t-test). Due to the high variability of some of the measures, a nonparametric analysis of variance, the Wilcoxon Rank Sum Test, was used where appropriate.

Necropsy and Histopathology

Prior to necropsy, the animals were anesthetized with pentobarbital (60 mg/kg b.w., i. p.) and blood samples were collected via cardiac puncture after the body weight was recorded. Following euthanasia via exsanguination, all external surfaces, orifices, all organs, and the thoracic, abdominal and pelvic cavities were examined for gross lesions.

During necropsy the following tissues were weighed: brain, liver, spleen, kidneys, adrenals, lungs, thymus, testes w/epididymides, ovaries, and heart.

The following tissues were harvested from each animal and preserved in 10% neutral buffered formalin:

skin	colon
mandibular and	cecum
mesenteric lymph nodes	rectum
mammary glands	liver
thigh muscle	pancreas
sciatic nerve	spleen
sternum	kidneys
femur with marrow	adrenals
thymus	urinary bladder
trachea	seminal vesicles
lungs with bronchi	prostate
heart and aorta	testes, including epididymides
thyroid	ovaries
parathyroids	uterus
esophagus	nasal cavity with turbinates
stomach	brain
duodenum	pituitary
jejunum	preputial or clitoral glands
tongue	Zymbal's gland
salivary gland	spinal cord
ileum	

Subsequently, these tissues were trimmed, processed and embedded in paraffin. Blocks were sectioned at 5 μ and slides were prepared and stained with hematoxylin and eosin. All tissues were examined in the high dose and control groups of both sexes. The spleen, kidneys, lungs and liver were examined in the remaining groups.

Inflammatory and degenerative lesions were graded according to severity using a scale of one to four (minimal, mild, moderate or marked). Data were tabulated according to individual animal and summarized by group. In addition, the gross observations and microscopic diagnoses were correlated for each animal. Labcat histopathology software was used for data management.

RESULTS

Food and Water Consumption

Overall food and water consumption data are listed in Table 1. The food consumption data shows a significant decrease ($p \leq 0.05$) in the 300 mg/kg group of both sexes as well as the 60 mg/kg male group. Water consumption was not significantly changed in females while the 300 mg/kg male group was marginally increased.

Using the food consumption data, the average daily dose levels of TNB received by group is presented in Table 2.

Body Weights, Organ Weights and Weight Ratios

Organ weights (heart, brain, spleen, adrenals, thymus, ovaries/testes, kidneys, lungs and liver) are given in Tables 3 (females) and 4 (males). Mean group values for organ to body weight ratios are present in Tables 5 (females) and 6 (males).

A significant decrease ($p \leq 0.05$) from control terminal body weight was noted in the 300 mg/kg female group.

Absolute organ weights were significantly ($p \leq 0.05$) different from the controls for the following:

- Brain - The 5 and 60 mg/kg female groups were increased.
- Heart - The female 300 mg/kg group was decreased.
- Spleen - The 300 mg/kg group of both sexes was increased.
- Thymus - The 300 mg/kg female group was decreased.

Organ weights as a percent of the total body weight were significantly ($p \leq 0.05$) different from controls for the following organs:

- Brain - The 60 and 300 mg/kg female groups were increased.
- Spleen - The 300 mg/kg groups of both sexes were increased.
- Liver - The 300 mg/kg groups of both sexes were increased.
- Kidneys - The 300 mg/kg male group was increased.

Hematology

Hematology analyses performed were total white blood cell count (WBC), platelet count, red blood cell count (RBC), methemoglobin (MetHb), hemoglobin, hematocrit, reticulocytes, Heinz bodies, MCV, MCH, MCHC, and differential leukocyte count. Group data are summarized in Tables 7 and 8. There were no significant ($p \leq 0.05$) changes between the control group and treated groups except for the following:

- 1) WBC and Differential: The total white blood cell count was elevated in the high dose group of both sexes.
- 2) RBC: A decrease in total red cell count in all male dose groups and the 300 mg/kg female group.
- 3) Hemoglobin: A decrease in the 300 mg/kg group of both sexes and the 60 mg/kg male group.
- 4) Hematocrit: A decrease in all male treated groups in addition to the 300 mg/kg female group.
- 5) Platelets: An increase in both sexes in the 300 mg/kg group.
- 6) Reticulocytes: An increase in reticulocytes in both sexes in the 300 mg/kg group and in the 60 mg/kg female group.
- 7) Methemoglobin: An increase in both sexes in the 300 mg/kg group and in the 60 mg/kg female group.

Clinical Chemistry

The following analytes were evaluated: glucose, blood urea nitrogen (BUN), creatinine, alkaline phosphatase (ALK phos), total protein, albumin, calcium, total bilirubin, aspartate aminotransferase (AST), alanine aminotransferase (ALT), sodium, potassium, phosphorus and triglycerides. The mean group values for each analyte are compiled in Tables 9 - 10. There were no significant ($p \leq 0.05$) differences between the control group and treated groups except for the following:

- 1) Total Protein: The 300 mg/kg female group was decreased while the male 300 mg/kg group was increased.
- 2) Albumin: The 300 mg/kg male group was elevated.
- 3) Calcium: The 300 mg/kg male group was elevated.
- 4) Total Bilirubin: The 60 mg/kg female group was decreased.
- 5) Blood Urea Nitrogen: The 300 mg/kg group of both sexes was increased.
- 6) Potassium: The 300 mg/kg female group was increased.
- 7) Triglycerides: The 300 mg/kg male group was decreased.

Clinical Observations

There were no clinical observations that were treatment related.

Survival

There were two early deaths recorded between the three month and six month sacrifice. Data is included in the two year sacrifice.

Gross Pathology

There were no treatment related gross observations.

Histopathology

All tissues were histopathologically examined in control and high dose animals of both sexes while the spleen, liver, lungs and kidneys were examined in the remainder of the groups.

The kidneys of male rats in the 60 and 300 mg/kg groups exhibited an increased incidence of cortical tubular hyaline droplet deposition. Chronic progressive nephropathy was present in all male groups with no treatment related severity difference. This diagnosis is comprised of a varying number of pathological changes which include: 1) tubular proteinaceous casts, 2) epithelial tubular lining cells ranging from flattened squamous cells to large basophilic cells, 3) thickened basement membranes involving tubules, capillaries and glomeruli, 4) cystic dilatation of Bowman's space with atrophic glomerular tufts, 5) interstitial lymphocytic infiltrates and fibrosis, 6) focal microconcretions 7) renal tubular cell hypertrophy and 8) tubular regeneration. Combinations of these changes were noted in all groups. These types of changes are considered spontaneous alterations of unknown etiology in male rats.

The spleen and bone marrow both featured minimal to mild erythroid cell hyperplasia with increased pigment (hemosiderin) deposition. This was evident in both sexes in the 60 and 300 mg/kg groups. This same compensatory change (regenerative anemia) can be noted in multiple organs but only the spleen was examined in all the animals.

The remaining diagnoses as listed in the tables should be considered spontaneous for F344 rats since their incidence or severity levels were low.

CONCLUSIONS

Administration of 1,3,5-trinitrobenzene in the diet to Fischer 344 rats at various doses for six months resulted in the following biologically significant findings:

1. Spleen, brain and liver relative organ weights were increased in the female 300 mg/kg group while the spleen, liver and kidneys were increased in males in this same group.
2. Hemoglobin and red blood cell levels were decreased in both sexes administered 300 mg/kg diet and in males receiving 60 mg/kg while

methemoglobin was increased in the 300 mg/kg group of both sexes and the 60 mg/kg female group.

3. Erythroid cell hyperplasia was increased in the 60 and 300 mg/kg groups of both sexes.
4. Terminal body weights were reduced in the female 300 mg/kg group.
5. Food consumption was decreased in both sexes in the 300 mg/kg group and the male 60 mg/kg group while water consumption was increased in the 300 mg/kg male group.
6. Excessive hyaline droplet formation was present in cortical renal tubules in male rats in the 60 and 300 mg/kg groups.

13. ABSTRACT (Maximum 200 words) Chronic toxic effects of 1,3,5 - Trinitrobenzene (TNB) in male and female Fischer rats were evaluated by feeding certified powdered laboratory chow diet supplemented with varied concentrations of TNB (0, 5, 60 and 300 mg/kg diet). This report discusses the 1 year findings of this two year study. Terminal body weights were reduced in both sexes receiving 300 mg/kg. The calculated average TNB consumption for females was 0.24, 2.93 and 14.90 mg/kg/day and 0.25, 2.96 and 14.61 mg/kg day for males. The brain, spleen, liver and heart relative organ weights were increased in both sexes in the 300 mg/kg group while the kidney weights were elevated in males only. Spleen and liver weights were also increased in the male 60 mg/kg group. Hemoglobin and hematocrit levels were decreased in both sexes in the 300 mg/kg group while methemoglobin was increased in this same group and the 60 mg/kg male group. Histopathological examinations suggested that the susceptible organs for TNB toxicity were kidneys (cytoplasmic/hyaline droplets) in the 60 and 300 mg/kg dose groups of both sexes and spleen (erythroid cell hyperplasia and/or pigment deposition) in both sexes in the same groups.

Study Personnel

Study Director: Tirumuru Reddy, Ph.D.

Study Coordinator/Biochemist: Barry Wiechman, B.S., M.S.

Pathologist: Greg Olson, D.V.M., Ph.D.

Ophthalmologist: David Wilkie, D.V.M., M.S.

Biostatistician: Joni Torsella, Ph.D.

Study Biological Technician: Bradley Peterson, A.S.

Histology Laboratory Supervisor: Sheree Lovelace, A.S.

Study Timetable:

Study Initiation: August 17, 1993

Initiation of Dosing: August 30, 1993

Interim Necropsy: August 31 and September 1, 1994

INTRODUCTION

Nitroaromatics, such as 1,3-dinitrobenzene (DNB), 1,3,5-trinitrobenzene (TNB), and N-methyl-N,2,4,6-tetranitroaniline (tetryl), have been detected as environmental contaminants of groundwater and soil near production sites and in some instances at military test grounds. TNB is formed as a by-product during 2,4,6-trinitrotoluene (TNT) production and can be formed through photochemical oxidative degradation of 2,4-dinitrotoluene a by-product released into the environment from TNT manufacturing (Burlinson, 1980; Spanggord et.al., 1982). TNB is not easily biodegradable, persists in the environment, eventually leaches out, and contaminates groundwater near waste disposal sites (Garman et.al., 1987). Exposure to TNB can occur through contact with wastewaters and soil at the original production sites and other plants devoted to munitions assembly which contain large quantities of these nitroaromatic compounds (Walsh and Jenkins, 1992).

Toxicity data on these compounds are limited. The oral LD₅₀ of DNB, TNB and tetryl were 59 mg/kg, 284 mg/kg and greater than 5 g/kg, respectively, in rats for combined sexes. TNB and tetryl were not toxic at 2 g/kg when applied to rabbit skin for 24 hours. However, the dermal LD₅₀ of DNB was 1.99 g/kg for combined sexes of rabbits. None of these compounds produced skin irritation but positive (DNB) and severe (TNB, tetryl) eye irritation potentials in rabbits were noted. The sensitization tests showed that DNB and tetryl are not skin sensitizers while TNB caused mild allergic reaction in guinea pigs (Fitzgerald et. al., 1992 a,b,c). Some of the toxicological effects of TNB are: formation of methemoglobin, testicular degeneration and reproductive failure, weight loss and anemia in hamsters, rats and mice. Neurological and hematological disorders have also been reported in dogs. DNB is toxic to humans; the estimated lethal dose range is 5-50 mg/kg and is readily absorbed through the skin (Von Burg, 1989). Tetryl was observed to be a powerful skin sensitizer in ammunition plant workers with dermatitis, liver atrophy, spleen effects, headaches, weight loss and respiratory irritation reported following exposure (U.S. EPA, 1990). Atmospheric concentration of 1.5 mg/m³ or below did not produce systemic poisoning in persons working with tetryl. DNB, TNB and tetryl have been shown to be genotoxic in the Salmonella mutagenesis assay (McGregor et. al., 1989) while TNB and DNB have been shown to form adducts of blood proteins and tissue DNA in rats (Reddy et. al.; 1991, 1995).

Objective of the Study

This study was conducted in order to evaluate the toxicity of 1,3,5-trinitrobenzene when administered in the diet for a two year period.

MATERIALS AND METHODS

Test Material Preparation

1,3,5-Trinitrobenzene powder (CAS #99-35-4) was supplied by the U.S. Army Biomedical Research and Development Laboratory. Analysis by HPLC revealed no detectable impurities. Certified powdered Purina Laboratory Chow 5002 was purchased (Ralston-Purina Co., St. Louis, MO) and stored at 4°C until used. First, 0.3 g of TNB was added to 50 g of powdered diet in a mortar and thoroughly ground with a pestle. Afterwards 250 g of the diet was added and mixed for 15 minutes followed by 350 g and mixed for an additional 15 minutes. Finally, the remaining diet (350 g) was added and mixed for 30 minutes in a mechanical mixer (Kitchen Aid, St. Joseph, MI) for uniform distribution of TNB in the diet. This was verified by determining the TNB concentration in the diet, taken from each of the 1 kg mixtures, by quantitative analysis done by HPLC. The premixed diet (0.3 g/kg) was further diluted with fresh powdered diet to obtain the desired TNB concentration in the lower dose groups. The diet feeders were changed twice a week.

Analyses of the TNB-feed mixtures were carried out on acetone extracts of the mixtures, utilizing a Waters 600E chromatography system (Waters, Milford, MA), equipped with a 490E programmable multiwavelength detector, operating at 245 nm. The entire chromatography system was interfaced with a Berthold HPLC computer program, Version 1.65 (Berthold, Nashua, NH). The TNB was eluted from a Zorbax C-8 column (9.4 mm x 25 cm) (MAC-DOD Analytical, Chadds Ford, PA) with a water-methanol gradient, at a flow rate of 3 ml/min. Working standards were prepared in Burdick and Jackson HPLC grade high purity methanol (Baxter, Obetz, OH).

Animals and Maintenance

Male and female Fischer 344 rats, confirmed free of viral antibodies, bacteria and parasites, were obtained from Charles River Laboratories, Kingston, New York. The animals, 7-8 weeks old and weighing approximately 140-175 g when delivered, were held for 1 week in quarantine prior to initiation of treatment. The animals were housed in a temperature (22-23°C) and humidity (40-60%) controlled room on a 12:12 hour light:dark cycle. For the study, they were housed individually in polycarbonate cages and water was administered ad libitum. Animal identification was done using electronic implants (Bio Medic, Maywood, NJ) with the rats assigned to control and treatment groups according to a computer-generated set of random numbers. The weight variation of the animals of each sex used did not exceed ± 2 s.d. of the mean weight at the time of delivery. The cages were identified with a color-coded identification card indicating the animal and treatment group. All aspects of the study were conducted in compliance with the guidelines of the American Association for Accreditation of Laboratory Animal Care.

All rats were observed daily for physiological and behavioral responses as well as for mortality or morbidity. Food and water consumption were recorded twice weekly. Body weights were taken prior to the start of the study, once weekly during the study and at the final sacrifice.

Experiment Groups

Group	Interim Sac. No. of Animals	Sex	mg TNB/kg diet
1	10	F	300
2	10	F	60
3	10	F	5
4	10	F	0
5	10	M	300
6	10	M	60
7	10	M	5
8	10	M	0

Hematology and Clinical Chemistry

Hematology parameters were assessed using a Serono-Baker Hematology Analyzer, Model 9000 (Serono-Baker, Allentown, PA). Total red and white blood cell counts, platelet count, differential leukocyte count, hemoglobin, packed cell volume, reticulocytes, MCV, MCH, MCHC and Heinz bodies were measured and computed. Methemoglobin samples were analyzed on a IL 482 Co-Oximeter.

Clinical chemistry was performed using a COBAS Fara II centrifugal analyzer (Roche, Nutley, NJ) with a non-selective electrode module. Clinical chemistry analytes included sodium, potassium, total protein, albumin, calcium, phosphorus, total bilirubin, blood urea nitrogen, creatinine, alanine aminotransferase, triglycerides, cholesterol, aspartate aminotransferase, glucose and alkaline phosphatase.

Statistical Evaluation

Males and females were considered separately in all statistical analyses. A one-factor (dose) analysis of variance (ANOVA) was used to analyze normally distributed measures: body weights, organ weights, organ weight ratios, food and water consumption, hematology and clinical chemistry. When a treatment effect was noted ($p \leq 0.05$, F-test) the difference between the control and the treatment groups was probed using a multiple comparison procedure (Dunnett's or Tukey's test). Due to the high variability of some of the measures, a nonparametric analysis of variance, the Wilcoxon Rank Sum Test, was used where appropriate.

Necropsy and Histopathology

Prior to necropsy, the animals were anesthetized with pentobarbital (60 mg/kg b.w., i. p.) and blood samples were collected via cardiac puncture after the body weight was recorded. Following euthanasia via exsanguination, all external surfaces, orifices, all organs, and the thoracic, abdominal and pelvic cavities were examined for gross lesions.

During necropsy the following tissues were weighed: brain, liver, spleen, kidneys, adrenals, lungs, thymus, testes w/epididymides, ovaries, and heart.

The following tissues were harvested from each animal and preserved in 10% neutral buffered formalin:

skin	colon
mandibular and	cecum
mesenteric lymph nodes	rectum
mammary glands	liver
thigh muscle	pancreas
sciatic nerve	spleen
sternum	kidneys
femur with marrow	adrenals
thymus	urinary bladder
trachea	seminal vesicles
lungs with bronchi	prostate
heart and aorta	testes, including epididymides
thyroid	ovaries
parathyroids	uterus
esophagus	nasal cavity with turbinates
stomach	brain
duodenum	pituitary
jejunum	preputial or clitoral glands
tongue	Zymbal's gland
salivary gland	spinal cord
ileum	

Subsequently, these tissues were trimmed, processed and embedded in paraffin. Blocks were sectioned at 5 μ and slides were prepared and stained with hematoxylin and eosin. All tissues were examined in the high dose and control groups of both sexes. The spleen, kidneys, lungs and liver were examined in the remaining groups.

Inflammatory and degenerative lesions were graded according to severity using a scale of one to four (minimal, mild, moderate or marked). Data were tabulated according to individual animal and summarized by group. In addition, the gross observations and microscopic diagnoses were correlated for each animal. Labcat histopathology software was used for data management.

RESULTS

Food and Water Consumption

Overall food and water consumption data are listed in Table 1. The food consumption data shows no significant differences amongst the groups. Water consumption was significantly increased ($p \leq 0.05$) in the 300 mg/kg group of both sexes.

Using the food consumption data, the average daily dose levels of TNB received by group is presented in Table 2.

Body Weights, Organ Weights and Weight Ratios

Organ weights (heart, brain, spleen, adrenals, thymus, ovaries/testes, kidneys, lungs and liver) are given in Tables 3 (females) and 4 (males). Mean group values for organ to body weight ratios are present in Tables 5 (females) and 6 (males).

Significant decreases ($p \leq 0.05$) from control terminal body weights were noted in both sexes in the 300 mg/kg group only.

Absolute organ weights were significantly ($p \leq 0.05$) different from controls for the following:

- Kidneys - The 300 mg/kg female group was decreased.
- Spleen - The 60 mg/kg male group was increased.
- Thymus - The 300 mg/kg male group was decreased.
- Adrenals - The 60 mg/kg female group was increased.

Organ weights as a percent of the total body weight were significantly ($p \leq 0.05$) different from controls for the following organs:

- Thymus - The 300 mg/kg male dose group had a decreased value.
- Lungs - The 300 mg/kg female dose group had an increased value.
- Brain - The 300 mg/kg dose group had an increased value in both sexes.
- Spleen - The 300 mg/kg group of both sexes had an increased value along with the 60 mg/kg male group.
- Liver - The 300 mg/kg group of both sexes had an increased value along with the 60 mg/kg male group.
- Heart - The 300 mg/kg dose group of both sexes had an increased value.
- Kidneys - The 300 mg/kg male dose group had an increased value.
- Adrenals - The 60 mg/kg female dose group had an increased value.

Hematology

Hematology analyses performed were total white blood cell count (WBC), platelet count, red blood cell count (RBC), methemoglobin (MetHb), hemoglobin, hematocrit, reticulocytes, Heinz bodies, MCV, MCH, MCHC, and differential leukocyte

count. Group data are summarized in Tables 7 and 8. There were no significant ($p \leq 0.05$) differences between the control group and treated groups except for the following:

- 1) WBC and Differential: An increase in the white blood cell count in the 300 mg/kg group of both sexes.
- 2) RBC: A decrease in total red cell count in the 300 mg/kg female group.
- 3) Hemoglobin: A decrease in the 300 mg/kg group of both sexes.
- 4) Hematocrit: A decrease in the 300 mg/kg group of both sexes.
- 5) Platelets: An increase in both sexes in the 300 mg/kg group.
- 6) Reticulocytes: An increase in reticulocytes in the female 300 mg/kg dose group.
- 7) Methemoglobin: An increase in both sexes in the 300 mg/kg dose group and in the 60 mg/kg female dose group.
- 8) MCV: A decrease in the 60 and 300 mg/kg male groups.
- 9) MCH: A decrease in the 60 and 300 mg/kg dose groups of both sexes.
- 10) MCHC: A decrease in the 300 mg/kg dose group of both sexes.

Clinical Chemistry

The following analytes were evaluated: glucose, blood urea nitrogen (BUN), creatinine, alkaline phosphatase (ALK phos), total protein, albumin, calcium, total bilirubin, aspartate aminotransferase (AST), alanine aminotransferase (ALT), sodium, potassium, phosphorus, cholesterol and triglycerides. The mean group values for each analyte are compiled in Tables 9 - 10. There were no significant ($p \leq 0.05$) differences between the control group and treated groups except for the following:

- 1) Total Protein: An increase in the 300 mg/kg dose group of both sexes.
- 2) Albumin: An increase in the male 300 mg/kg dose group.
- 3) Blood Urea Nitrogen: The 300 mg/kg dose group of both sexes was increased.
- 4) Creatinine: An increase in the female 300 mg/kg dose group.
- 5) Alanine Aminotransferase: A decrease in the male 300 mg/kg dose group.

6) Alkaline Phosphatase: A decrease in the male 300 mg/kg dose group.

7) Cholesterol: An increase in the female 300 mg/kg dose group.

Clinical Observations

There were no treatment related clinical observations.

Survival

There have been three early deaths up to the one year sacrifice date with groups 5, 7 and 8 each having one apiece.

Gross Pathology

A mild sporadic decrease in testicular size in the 300 mg/kg dose group was the only apparent treatment related observation.

Histopathology

All tissues were histopathologically examined in control and high dose animals of both sexes while the spleen, liver, lungs and kidneys were examined in the remainder of the groups.

The kidneys of both sexes in the 60 and 300 mg/kg groups exhibited an increased incidence of cortical tubular cytoplasmic/hyaline droplet deposition. These droplets were morphologically similar to the droplets noted at earlier sacrifice times except for the diminished intensity of eosinophilic staining and being noted in females as well as males.

The spleen featured minimal to mild erythroid cell hyperplasia and/or increased pigment (hemosiderin) deposition. These changes were evident in the 60 and 300 mg/kg groups. This same compensatory change (regenerative anemia) can be noted in multiple organs but only the spleen was examined in all the animals.

The testes were characterized in sixty percent of high dose males and twenty percent of controls by seminiferous tubular degeneration. The affected tubules were lined by fewer spermatogenic cells and contained a reduced number of mature spermatides. The diameter of the affected tubules was decreased with the interstitium being more condensed and prominent.

The remaining diagnoses as listed in the tables should be considered spontaneous for one year old F344 rats.

CONCLUSIONS

Administration of 1,3,5-trinitrobenzene in the duct to Fischer 344 rats at various doses for one year resulted in the following biologically significant findings:

1. Terminal body weights were reduced in both sexes in the 300 mg/kg group.
2. The brain, spleen, liver and heart relative organ weights were increased in the 300 mg/kg group of both sexes while the kidneys were elevated in males only in this same group.
3. Spleen and liver relative organ weights were increased in the male 60 mg/kg group while the adrenals were increased in females.
4. Hemoglobin and hematocrit levels were decreased in both sexes in the 300 mg/kg dose group while methemoglobin was increased in this same group and the 60 mg/kg male group.
5. Increased splenic erythroid cell hyperplasia and/or pigment deposition were noted in both sexes in the 60 and 300 mg/kg groups.
6. Seminiferous tubular degeneration was evident in the 300 mg/kg male group.
7. Cortical renal cytoplasmic/hyaline droplet deposition was increased in the 60 and 300 mg/kg groups of both sexes.

Animal ID: 1-022

Pathologist: GRO

Animal Fate: Terminal Sacrifice

Days on Test: 366

Reference to Necropsy Record:

Related Histopathology:

UTERUS - Bilateral, Dilation, 8x8x47mm, 2, Irregular,
Tan

UTERUS - Dilatation, Bilateral

Animal ID: 1-025

Pathologist: GRO

Animal Fate: Terminal Sacrifice

Days on Test: 366

Reference to Necropsy Record:

Related Histopathology:

PITUITARY - Mass, 2x2mm, 1, Round, Dark Red

PITUITARY - Adenoma, Pars Distalis

Animal ID: 1-026

Pathologist: GRO

Animal Fate: Terminal Sacrifice

Days on Test: 366

Reference to Necropsy Record:

Related Histopathology:

THYMUS - Decrease in size, 10x4x1mm

THYMUS - Atrophy

UTERUS - Bilateral, Enlarged, (Right) 37x8x5mm,
(Left) 35x6x4mm

UTERUS - Dilatation, Bilateral

Animal ID: 1-049

Pathologist: GRO

Animal Fate: Terminal Sacrifice

Days on Test: 366

Reference to Necropsy Record:

Related Histopathology:

UTERUS - Bilateral, Dilated, 33x7x7mm

UTERUS - Dilatation, Bilateral

APPENDIX M

PROTOCOL AND
AMENDMENTS

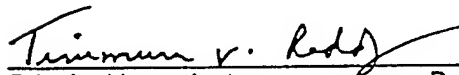

PROTOCOL

Two Year Chronic Toxicity Study of 1,3,5-Trinitrobenzene in F344 Rats

This study will be conducted in agreement with Good Laboratory Practice Standards, Environmental Protection Agency, Toxic Substances Control Act (TSCA) 40 CFR Part 792 (Federal Register, Vol 54, No. 158, August 17, 1989, pp. 34034 - 34050). All aspects of the studies will be conducted in accordance with written Standard Operating Procedures (SOP) of the performing unit and all raw data and performance documents will be maintained in agreement with GLP. An administratively separate quality assurance unit (QAU from PAI) will monitor the studies to assure adherence to good laboratory practices and the approved SOPs. Any deviation from the protocol or GLP will be noted in the raw data and reflected in the final report.

JULY 1, 1993

TITLE: Two year Chronic Toxicity Evaluation of 1,3,5-Trinitrobenzene (TNB), in F344 Rats.

BACKGROUND:

Nitroaromatics, such as 1,3,5-trinitrobenzene (TNB), 1,3-dinitrobenzene (DNB), and N-methyl-N,2,4,6-tetranitroaniline (tetryl), have been detected as environmental contaminants of groundwater and soil near production sites and in some instances at military test grounds. The wastewaters discharged from trinitrotoluene (TNT) manufacturing processes contain a variety of aromatic compounds, including DNB and TNB. TNB is formed during the nitration step of TNT synthesis as a result of oxidation of methyl groups. Although the complete mechanism of TNB formation during TNT photolysis is unknown, Burlinson (1980) suggested that it is produced by decarboxylation of 2,4,6-trinitrobenzaldehyde, a major TNT photoproduct. It is also found in aquatic systems and surface soils as by-products of photolysis of TNT. DNB and TNB are not easily biodegradable, persist in the environment, eventually leach out and contaminate groundwater near waste disposal sites. Tetryl is an explosive that has been in use, largely for military purposes, since 1906. Wastewaters and soil at the original production sites and other plants devoted to munitions assembly, contain large quantities of tetryl. A recent estimate of tetryl in wastewaters generated from the production of tetryl at the Joliet Army Ammunition Plant was about 36 lb/per day of each production line.

Toxicity data on these compounds are limited. The oral LD50 of DNB, TNB and tetryl were 59 mg/kg, 284 mg/kg and greater than 5 g/kg, respectively, in rats for combined sexes. TNB and tetryl were not toxic at 2 g/kg when applied to rabbit skin for 24 hours. However, the dermal LD50 of DNB was 1.99 g/kg for combined sexes of rabbits. None of these compounds produced skin irritation potentials, but positive (DNB) and severe (TNB, tetryl) eye irritation potentials in rabbits. The sensitization tests showed that DNB and tetryl are not skin sensitizers while TNB caused mild allergic reaction in guinea pigs. Some of the toxicological and behavioral effects of DNB are: formation of methemoglobin, testicular degeneration and reproductive failure, and weight loss and anemia in hamsters, rats and mice. Neurological and hematological disorders have also been reported in dogs. DNB is rather toxic to humans; the estimated lethal dose range is 5-50 mg/kg. It is readily absorbed through the skin. Fetal doses (amount and route of administration are not given) of tetryl produced toxic degeneration (necrosis) in the kidneys of dogs and rabbits and liver necrosis in dogs (not in rabbits). Tetryl was observed to be a powerful skin sensitizer in ammunition plant workers. Hardy and Maloof (1950) reported effects from accidental exposure of 11 people to tetryl: 2 died, 1 was disabled and 8 did not detect permanent disability. They also reported irreversible liver damage, dermatitis, and upper respiratory irritation following tetryl exposure. The effects of tetryl exposure include gastrointestinal symptoms and epidermal, respiratory, nervous system, hematopoietic and circulatory injury. Atmospheric concentration of 1.5 mg/m³ or below did not produce systemic poisoning in persons working with tetryl. DNB, TNB, and tetryl have been shown to be genotoxic in *Salmonella* mutagenesis assay. TNB has been shown to form adducts of blood proteins and tissue DNA in rats.

PROTOCOL

1. Study. Two year chronic toxicity evaluation of 1,3,5-trinitrobenzene (TNB) in male and female Fischer (344) rats.
2. Study Schedule. Study start date: To be determined.
Necropsy dates: To be determined.
Study completion date: To be determined.
3. Purpose. To evaluate chronic toxicity of TNB when administered in the diet for two years. This route was chosen because of the poor solubility of TNB.
4. Study Location. A.W. Breidenbach Environmental Research Center
U.S. Environmental Protection Agency
Cincinnati, OH 45268
5. Sponsor and Address. U.S. Army Biomedical Research and Development
Laboratory, Fort Detrick
Frederick, Maryland 21701-5010
6. Principle Investigator. T.V. Reddy, Ph.D., Research Chemist
Environmental Monitoring Systems Laboratory
U.S. Environmental Protection Agency
Cincinnati, Ohio 45268
7. Co-Principle Investigator. F. Bernard Daniel, Ph.D.
Environmental Monitoring Systems Laboratory
U.S. Environmental Protection Agency
Cincinnati, Ohio 45268
8. Study Biochemist. Barry Wiechman, MS., Pathology Associates (PAI)
9. Project Manager. G. R. Olson, DVM, Ph.D., Pathology Associates (PAI)
10. Regulatory Compliance. This study will be carried out according to U.S. EPA Health Effects testing guidelines (40 CFR 798) in compliance with GLP (40 CFR 792). Recent recommendations (1992) of the American Association of Clinical Chemistry will be incorporated where applicable.
11. Quality Assurance. All critical phases, data and final report will be audited by the Quality Assurance Unit in accordance with GLP's by Pathology Associates, West Chester, Ohio 45069.

12. Test Material.

1,3,5-Trinitrobenzene (TNB) Powder (CAS #99-35-4) is supplied by U.S. Army Biomedical Research and Development Laboratory, Ft. Detrick, Frederick, Maryland 21702.

13. Experimental Design.

- A. Selection of Dose: Toxikon Corporation, Woburn, MA 01801 has conducted acute toxicity studies on TNB. They administered TNB in corn oil to rats at a single oral (Bolus) dose and observed the clinical signs for 14 days, following dosing. Based on the results they established 298 mg/kg BW, and 275 mg/kg BW, as the LD50 dose for male and female rats, respectively. For combined sexes the reported LD50 dose was 284 mg/kg body weight. Based on the above report, the following 5 concentrations were tested in rats in a 14 day range finding study (120, 80, 40, 20, 5 mg/kg BW). Selection of doses for a 90 day subchronic toxicity study were determined from the 14 day range finding experiment and were as follows: 60, 30 and 5 mg/kg BW. Control rats were fed only powdered chow diet.
- B. Preparation of the Diet: Certified powdered Purina laboratory chow meal 5002 will be purchased from Purina labs and stored at 4°C until use. There were no known contaminants in the certified diet that could affect the outcome of the study. TNB diets are prepared once a week. Just before the diet preparation, TNB is removed from storage shelves, weighed for the desired concentration in the carcinogen room and mixed in the hood with appropriate powdered diet. The three desired doses for the two year study will be selected from the 90 day study and the concentrations are 300, 60 and 5 mg TNB/kg diet. The expected target doses are 30, 6 and 0.5 mg/kg body weight.
- C. Animals: 285 male F344 rats weighing 100-115 gm, and 285 female F344 rats weighing 85-100 gm will be purchased from Charles River Laboratories and held for 1 week quarantine. After evaluation of the serological data and soon after release from quarantine, 5 rats from each sex are sacrificed and used for base line control animals to ensure the animals are healthy and within normal limits for all measurements at the time of arrival and after quarantine. The animals will be identified with electronic implants and housed individually in clear polycarbonate shoe boxes with aspen bedding (San I Chips supplied by P.J. Murphy, Forest Products Corporation, NJ). Shoe boxes and bedding are changed along with food and water (2 times a week). Food and water will be given ad libitum. Water is provided with 16 ounce bottles and stoppers and sipper tubes. At all times the animal rooms are maintained on a 12 hour light/dark cycle at 22-23°C with a relative humidity range of 40-60%.
- D. Randomization: Using computer-generated random numbers animals are assigned to groups. At the time of randomization, the weight variation of the animals of each sex used will not exceed ± 2 S.D. of the mean weight, and the mean body weights for each group of each sex will not be statistically different. Grouping of animals and sacrifice times are indicated in table 1.

TABLE I: Experimental Design with Fischer (F344) Rats for Chronic 2 Year Bioassay with Sacrifice times at the End of 3, 6, 12 and 24 Months

Sacrifice Time - Months	# of TNB Doses	# of Rats per TNB Dose	Minimum # of Rats Sacrificed per TNB Dose	# of Rats in Control Group	# of Rats Sacrificed in Control Group
3	A	75	10	60	10
	B	75	10		
	C	75	10		
6	A	65	10	50	10
	B	65	10		
	C	65	10		
12	A	55	10	40	10
	B	55	10		
	C	55	10		
24	A	45	45	30	30
	B	45	45		
	C	45	45		

A,B,C Three different doses will be determined from 90 day study. Total number of male rats 285. (225 for test and 60 as control).

E. Justification: Rats historically have been used in safety evaluation studies and are recommended by appropriate regulatory agencies.

F. Analysis of the Diet: The purity of TNB was determined by HPLC and found to be more than 99%. The homogeneity and stability of TNB in the diet will be determined by analyzing the TNB content (by HPLC) in the diet, soon after each weekly diet preparation. Analyses of the TNB-feed samples will be carried out by extracting 20 grams of TNB diet with 100 ml of acetone or methanol for 150 minutes. The mixture is then centrifuged at 10,000 g for 2 minutes with the organic phase being used for quantitation utilizing a Waters 600E chromatography system (Waters, Milford, MA), equipped with a 490E programmable multiwavelength detector, operating at 254 nm. The entire chromatography system is interfaced with a Berthold HPLC computer program Version 1.65 (Berthold Co., Nashua, NH). The TNB is eluted from a Zorbax C-8 column (9.4mm x 25 cm) (MAC-DOD Analytical, Chadds Ford, PA), with a water-methanol gradient at a flow rate of 3 mL/min. Working standards are prepared in Burdick and Jackson HPLC grade high purity methanol (Baxter, Oletz, OH).

G. Observation of Animals:

(1) Clinical

Observations:

Twice daily - mortality and morbidity check.

Once daily - cageside observation for obvious indications of a toxic effect; these effects will be recorded as they are observed.

Data for mortality and morbidity checks and cageside observations will be recorded on the same form.

(2) Physical

Examinations:

At each weighing interval. These observations will include, but not be limited to, changes in: skin and fur; eyes and mucous membranes; respiratory, circulatory, autonomic and central nervous systems; some motor activity and behavior.

(3) Body Weight:

Prior to treatment and weekly, thereafter.

(4) Food Consumption: Weekly.

(5) Water Consumption: Weekly.

(6) Ophthalmoscopic

Examination:

Prior to the start of treatment and at the termination of the study by a board certified veterinarian.

H. Clinical Pathology:

- (1) Frequency: At 3, 6, 12 and 24 months of TNB exposure.
- (2) Number of Animals: Ten animals per dose group of each sex.

I. Tests:

(1) Hematology

Total leukocyte count
Differential leukocyte count
Erythrocyte count
Platelet count
Hemoglobin concentration
Hematocrit
Mean corpuscular volume
Mean corpuscular hemoglobin
Mean corpuscular hemoglobin concentration
Reticulocyte count
Methemoglobin
Heinz bodies

(2) Serum Chemistry

Glucose
Urea nitrogen
Creatinine
Total protein
Albumin
Globulin
Calcium
Phosphorus
Sodium
Potassium
Chloride
Cholesterol
Alanine Aminotransferase
Aspartate Aminotransferase
Alkaline Phosphatase

(3) Urinalysis

Tests to be conducted will be addressed by an amendment after analysis of clinical pathology and histopathology results at 3 and 6 months.

J. Termination:

(1) Unscheduled Sacrifices and Deaths

Necropsies, by trained personnel using procedures approved by board-certified pathologists, will be conducted on all moribund animals

and on all animals that die.

(2) Sacrifice

After 3, 6, 12 and 24 months of treatment, all surviving animals will be weighed and then fasted for 12 hrs. All rats will be anesthetized with sodium pentobarbital and exsanguinated. Necropsies will be conducted on each animal by trained personnel using procedures approved by board-certified pathologists. Animals will be sacrificed in random order to eliminate bias.

A pathologist will be present for consultation.

K. Postmortem Procedures:

(1) Gross Necropsy

A complete gross examination will be performed on all animals, including those which died during the study or are sacrificed in moribund conditions.

(2) Organ Weights

For each terminally sacrificed animal, the following organs (when present) will be weighed following careful dissection and trimming to remove fat and other contiguous tissue in a uniform manner:

brain	lungs
liver	thymus
spleen	testes with epididymides/ovaries
kidneys	heart
adrenals	

(3) Tissue Preservation

The following tissues (when present) from each animal will be preserved in 10% neutral buffered formalin:

skin	ileum
mandibular and	colon
mesenteric lymph nodes	cecum
mammary glands	rectum
thigh muscle	liver
sciatic nerve	pancreas
sternum with marrow	spleen
femur with marrow	kidneys
larynx	adrenals
thymus	urinary bladder
trachea	seminal vesicles
lungs and bronchi	prostate

heart and aorta
thyroid
parathyroids
esophagus
stomach
duodenum
jejunum
tongue
salivary gland
eyes

testes, including epididymis
ovaries
uterus
nasal cavity and nasal turbinates
brain
pituitary
preputial or clitoral glands
Zymbal's gland
spinal cord (3 areas)

L. Histopathology:

The following histopathology will be performed:

- (1) Full histopathology on the organs and tissues listed below of all rats in the control and high dose groups and of all animals that died or were killed during the study.

The tissues to be examined are as follows:

cerebrum	pancreas
cerebellum	cecum
trachea	colon
thyroid	rectum
parathyroid	stomach
esophagus	skeletal muscle
salivary gland	sciatic nerve
harderian gland	tongue
skin	heart
mammary gland	
aorta	nasal region
lung	sternum
thymus	femur
spleen	vertebrae
mesenteric lymph node	spinal cord (3 areas)
liver	adrenals
kidney	pituitary
urinary bladder	eye(s)
duodenum	jejunum
auditory sebaceous gland	
ileum	

MALE

FEMALE

accessory sex glands
epididymis
testes

uterus
ovaries

- (2) All gross lesions in all animals.
- (3) Target organs in all animals

- (4) Lungs, liver and kidneys of all animals.

Note: If excessive early deaths or other problems occur in the high dose group then the next dose level will be examined.

- (5) Following completion of the study, all wet tissues, paraffin blocks and slides will be placed in the EPA storage facility along with all raw data.

M. Final Report:

Two months after the termination of the in-life phase of the study, a draft report which includes the following information (as appropriate) will be prepared and submitted to the sponsor:

- (1) Experimental Design and Methods

- (2) Results

mortality	organ weights and organ/body
clinical observations	weight ratios
body weights	gross pathology
food and water consumption	histopathology
clinical pathology tests	ophthalmology findings

Statistical Evaluation:

SAS® computer software will be used for statistical analysis. Dunnet's t-test will be used for comparing treatment groups.

Kruskal-Wallis rank sums will be used to examine the differences among the treatment groups and Wilcoxon rank sum test will be used to analyze pairwise differences between the control and each dose group.

Deviations from GLP's and/or Protocol

1. Tukey's test for statistically comparing treatment groups was sometimes used as well as Dunnett's test. This does not effect the quality of the data.
2. The animal room temperature and humidity values varied slightly from the protocol but were within those guidelines recommended by the U.S. Public Health Service (NIH).
3. Analysis for triglycerides was done at the 6, 12 and 24 month sacrifice times. This was added to enhance the data per the sponsor's approval.
4. Three male rats in the 300 mg/kg group were removed from the study at 6 months for biomarker analysis at the request of the sponsor.
5. Tissues from severely autolyzed animals were discarded. This does not effect the integrity of the data.
6. Clinical observations were recorded in the study book on a weekly basis. This does not effect the quality of the data.
7. Kidney sections were also stained for alpha-2 μ -globulin using immunohistochemical techniques to further characterize the renal droplets.

STATEMENT

Study No. 93-004

Study Title: Two Year Chronic Toxicity Study of 1,3,5-Trinitrobenzene in F344 Rats

QUALITY ASSURANCE STATEMENT

The portions of this toxicology project performed and reported by Pathology Associates International has been inspected and audited by the quality assurance unit as required by the Good Laboratory Practice (GLP) standards promulgated by the U.S. Environmental Protection Agency. Results of these activities indicate that the portions of the study performed and reported by PAI conformed with GLP standards and applicable Standard Operating Procedures. The following table is a record of the inspections/audits performed and reported by the QAU.
